Grammar

The Logtalk grammar is here described using Backus-Naur Form syntax. Non-terminal symbols in *italics* have the definition found in the ISO Prolog Standard. Terminal symbols are represented in a *fixed width font* and between double-quotes.

**Entities**

entity ::= object | category | protocol

**Object definition**

object ::= begin_object_directive [ object_directives ] [ clauses ] end_object_directive.

begin_object_directive ::= ":- object(" object_identifier [ "," object_relations ") ."

end_object_directive ::= ":- end_object."

object_relations ::= prototype_relations | non_prototype_relations

prototype_relations ::= prototype_relation | prototype_relation "," prototype_relations

prototype_relation ::= implements_protocols | imports_categories | extends_objects

non_prototype_relations ::= non_prototype_relation | non_prototype_relation "," non_prototype_relations

non_prototype_relation ::= implements_protocols |
Category definition

category ::= 
    begin_category_directive [ category_directives ] [ clauses ] end_category_directive.

begin_category_directive ::= 
    ":- category(" category_identifier [ "," category_relations ] ")." 

end_category_directive ::= 
    ":- end_category." 

category_relations ::= 
    category_relation | 
    category_relation "," category_relations 

category_relation ::= 
    implements_protocols | 
    extends_categories | 
    complements_objects 

Protocol definition

protocol ::= 
    begin_protocol_directive [ protocol_directives ] end_protocol_directive.

begin_protocol_directive ::= 
    ":- protocol(" protocol_identifier [ "," extends_protocols ] ")." 

end_protocol_directive ::= 
    ":- end_protocol."
Entity relations

extends_protocols ::= 
"extends(" extended_protocols ")"

extends_objects ::= 
"extends(" extended_objects ")"

extends_categories ::= 
"extends(" extended_categories ")"

implements_protocols ::= 
"implements(" implemented_protocols ")"

imports_categories ::= 
"imports(" imported_categories ")"

instantiates_classes ::= 
"instantiates(" instantiated_objects ")"

specializes_classes ::= 
"specializes(" specialized_objects ")"

complements_objects ::= 
"complements(" complemented_objects ")"

Implemented protocols

implemented_protocols ::= 
implmented_protocol | 
implemented_protocol_sequence | 
implemented_protocol_list

implemented_protocol ::= 
protocol_identifier | 
scope ":" protocol_identifier

implemented_protocol_sequence ::= 
implemented_protocol | 
implemented_protocol_sequence, implemented_protocol_sequence

implemented_protocol_list ::= 
"(" implemented_protocol_sequence ")"

Extended protocols

extended_protocols ::= 
extended_protocol | 
extended_protocol_sequence | 
extended_protocol_list

extended_protocol ::= 
protocol_identifier |
scope "::" protocol_identifier

extended_protocol_sequence ::= 
  extended_protocol | 
  extended_protocol "," extended_protocol_sequence

extended_protocol_list ::= 
" [ " extended_protocol_sequence "]"

**Imported categories**

imported_categories ::= 
  imported_category | 
  imported_category_sequence | 
  imported_category_list

imported_category ::= 
  category_identifier | 
  scope "::" category_identifier

imported_category_sequence ::= 
  imported_category | 
  imported_category "," imported_category_sequence

imported_category_list ::= 
" [ " imported_category_sequence "]"

**Extended objects**

extended_objects ::= 
  extended_object | 
  extended_object_sequence | 
  extended_object_list

extended_object ::= 
  object_identifier | 
  scope "::" object_identifier

extended_object_sequence ::= 
  extended_object | 
  extended_object "," extended_object_sequence

extended_object_list ::= 
" [ " extended_object_sequence "]"

**Extended categories**

extended_categories ::= 
  extended_category | 
  extended_category_sequence | 
  extended_category_list

extended_category ::= 
  category_identifier |
scope ": :" category_identifier

extended_category_sequence ::= extended_category \\
extended_category "," extended_category_sequence

extended_category_list ::= "{ " extended_category_sequence " }"

**Instantiated objects**

instantiated_objects ::= instantiated_object \\
instantiated_object_sequence \\
instantiated_object_list

instantiated_object ::= object_identifier \\
scope ": :" object_identifier

instantiated_object_sequence ::= instantiated_object \\
instantiated_object "," instantiated_object_sequence |

instantiated_object_list ::= "{ " instantiated_object_sequence " }"

**Specialized objects**

specialized_objects ::= specialized_object \\
specialized_object_sequence \\
specialized_object_list

specialized_object ::= object_identifier \\
scope ": :" object_identifier

specialized_object_sequence ::= specialized_object \\
specialized_object "," specialized_object_sequence |

specialized_object_list ::= "{ " specialized_object_sequence " }"

**Complemented objects**

complemented_objects ::= object_identifier \\
complemented_object_sequence \\
complemented_object_list

complemented_object_sequence ::= object_identifier
object_identifier "," complemented_object_sequence
complemented_object_list ::= "[" complemented_object_sequence "]"

Entity and predicate scope

scope ::= "public" | "protected" | "private"

Entity identifiers

dentity_identifiers ::= entity_identifier | entity_identifier_sequence | entity_identifier_list
dentity_identifier ::= object_identifier | protocol_identifier | category_identifier
dentity_identifier_sequence ::= entity_identifier | entity_identifier , entity_identifier_sequence
dentity_identifier_list ::= "[" entity_identifier_sequence "]"

Object identifiers

object_identifiers ::= object_identifier | object_identifier_sequence | object_identifier_list
object_identifier ::= atom | compound
object_identifier_sequence ::= object_identifier | object_identifier , object_identifier_sequence
object_identifier_list ::= "[" object_identifier_sequence "]"

Category identifiers

category_identifiers ::= category_identifier |
category_identifier_sequence |
category_identifier_list

category_identifier ::= 
  atom |
  compound

category_identifier_sequence ::= 
  category_identifier |
  category_identifier , " category_identifier_sequence

category_identifier_list ::= 
  " [ " category_identifier_sequence " ] "

Protocol identifiers

protocol_identifiers ::= 
  protocol_identifier |
  protocol_identifier_sequence |
  protocol_identifier_list

protocol_identifier ::= 
  atom

protocol_identifier_sequence ::= 
  protocol_identifier |
  protocol_identifier , " protocol_identifier_sequence

protocol_identifier_list ::= 
  " [ " protocol_identifier_sequence " ] "

Module identifiers

module_identifier ::= 
  atom

Source file names

source_file_names ::= 
  source_file_name |
  source_file_name_list

source_file_name ::= 
  atom |
  library_source_file_name

library_source_file_name ::= 
  library_name " ( " atom " ) "

library_name ::= 
  atom

source_file_name_sequence ::= 
  source_file_name |
source_file_name_list ::= " [source_file_name_sequence ] "

## Directives

### Source file directives

source_file_directives ::= 
  source_file_directive | 
  source_file_directive source_file_directives

source_file_directive ::=  
  " :- encoding( atom ). " | 
  " :- set_logtalk_flag( atom , nonvar ). " |

### Conditional compilation directives

conditional_compilation_directives ::= 
  conditional_compilation_directive | 
  conditional_compilation_directive conditional_compilation_directives

conditional_compilation_directive ::=  
  " :- if( callable ). " | 
  " :- elif( callable ). " | 
  " :- else. " | 
  " :- endif. "

### Object directives

object_directives ::= 
  object_directive | 
  object_directive object_directives

object_directive ::=  
  " :- initialization( callable ). " | 
  " :- built_in. " | 
  " :- threaded. " | 
  " :- dynamic. " | 
  " :- uses( object_identifier ). " | 
  " :- use_module( module_identifier , module_predicate_indicator_alias_list ). " | 
  " :- calls( protocol_identifiers ). " | 
  " :- info( entity_info_list ). " | 
  " :- set_logtalk_flag( atom , nonvar ). " |

### Category directives

category_directives ::= 
  category_directive |
category_directive category_directives

category_directive ::=  
  ":- built_in.” |  
  ":- dynamic.” |  
  ":- uses(" object_identifier ").” |  
  ":- use_module(" module_identifier "," predicate_indicator_alias_list ").” |  
  ":- calls(" protocol_identifiers ").” |  
  ":- info(" entity_info_list ").” |  
  ":- set_logtalk_flag(" atom "," nonvar ").” |  
predicate_directives

Protocol directives

protocol_directives ::=  
  protocol_directive |  
  protocol_directive protocol_directives

protocol_directive ::=  
  ":- built_in.” |

Compiler flags

compiler_flag ::= 
    flag(flag_value)
Directives
**encoding/1**

**Description**

```prolog
encoding(Encoding)
```

Declares the source file text encoding. This is an experimental source file directive, which is only supported on some back-end Prolog compilers. When used, this directive must be the first term in the source file in the first line. Currently recognized encodings values include 'US-ASCII', 'ISO-8859-1', 'ISO-8859-2', 'ISO-8859-15', 'UCS-2', 'UCS-2LE', 'UCS-2BE', 'UTF-8', 'UTF-16', 'UTF-16LE', 'UTF-16BE', 'UTF-32', 'UTF-32LE', 'UTF-32BE', 'Shift_JIS', and 'EUC-JP'. Be sure to use an encoding supported by the chosen back-end Prolog compiler (whose adapter file must define a table that translates between the Logtalk and Prolog-specific atoms that represent each supported encoding). When writing portable code that cannot be expressed using ASCII, 'UTF-8' is usually the best choice.

**Template and modes**

```prolog
encoding(+atom)
```

**Examples**

```prolog
:- encoding('UTF-8').
```
**set_logtalk_flag/2**

**Description**

```
set_logtalk_flag(Flag, Value)
```

Sets Logtalk flag values. The scope of this directive is the entity containing it or the source file being compiled. For global scope, use the corresponding `set_logtalk_flag/2` built-in predicate within an `initialization/1` directive.

**Template and modes**

```
set_logtalk_flag(+atom, +nonvar)
```

**Errors**

- Flag is a variable:
  - `instantiation_error`
- Value is a variable:
  - `instantiation_error`
- Flag is not an atom:
  - `type_error(atom, Flag)`
- Flag is neither a variable nor a valid flag:
  - `domain_error(flag, Flag)`
- Value is not a valid value for flag Flag:
  - `domain_error(flag_value, Flag + Value)`
- Flag is a read-only flag:
  - `permission_error(modify, flag, Flag)`

**Examples**

```
:- set_logtalk_flag(unknown_entities, silent).
```
if/1

Description

\[
\text{if}(\text{Goal})
\]

Starts conditional compilation. The code following the directive is compiled if \text{Goal} is true. The goal is subjected to goal expansion before execution.

Template and modes

\[
\text{if}(\text{@callable})
\]

Examples

\[
:= \text{if}([\text{current}\_\text{prolog}\_\text{flag}(\text{double}\_\text{quotes}, \text{atom})]).
\]

See also

\text{elif/1, else/0, endif/0}
**elif/1**

**Description**

```
elif(Goal)
```

Supports embedded conditionals when performing conditional compilation. The code following the directive is compiled if `Goal` is true. The goal is subjected to goal expansion before execution.

**Template and modes**

```
elif(@callable)
```

**Examples**

```
:- elif(predicate_property(callable(_), built_in)).
```

**See also**

`else/0`, `endif/0`, `if/1`
else/0

Description

else

Starts a else branch when performing conditional compilation.

Template and modes

else

Examples

:= else.

See also

elif/1, endif/0, if/0
**endif/0**

**Description**

```xml
endif
```

Ends conditional compilation for the matching `if/1` directive.

**Template and modes**

```xml
endif
```

**Examples**

```xml
:- endif.
```

**See also**

`elif/0`, `else/0`, `if/1`
### built_in/0

**Description**

```plaintext
built_in
```

Declares an entity as built-in. Built-in entities cannot be redefined.

**Template and modes**

```plaintext
built_in
```

**Examples**

```plaintext
:= built_in.
```
category/1-3

Description

category(Category)
category(Category, implements(Protocols))
category(Category, extends(Categories))
category(Category, complements(Objects))
category(Category, implements(Protocols), extends(Categories))
category(Category, implements(Protocols), complements(Objects))
category(Category, extends(Categories), complements(Objects))
category(Category, implements(Protocols), extends(Categories), complements(Objects))

Starting category directive.
Template and modes

category(+category_identifier)
category(+category_identifier, implements(+implemented_protocols))
category(+category_identifier, extends(+extended_categories))
category(+category_identifier, complements(+complemented_objects))
category(+category_identifier, implements(+implemented_protocols), extends(+extended_categories))
category(+category_identifier, implements(+implemented_protocols), complements(+complemented_objects))
category(+category_identifier, extends(+extended_categories), complements(+complemented_objects))
category(+category_identifier, implements(+implemented_protocols), extends(+extended_categories), complements(+complemented_objects))

Examples

:- category(monitoring).
:- category(monitoring, implements(monitoringp)).
:- category(attributes, implements(protected::variables)).
:- category(extended, extends(minimal)).
:- category(logging, implements(monitoring), complements(employee)).

See also

drop_category/0
**dynamic/0**

**Description**

```
dynamic
```

Declares an entity and its contents as dynamic. Dynamic entities can be abolished at runtime.

**Template and modes**

```
dynamic
```

**Examples**

```
:- dynamic.
```

**See also**

dynamic/1
end_category/0

Description

end_category

Ending category directive.

Template and modes

end_category

Examples

:= end_category.

See also

category/1-3
end_object/0

Description

end_object

Ending object directive.

Template and modes

end_object

Examples

:- end_object.

See also

object/1-5
**end_protocol/0**

**Description**

```
end_protocol
```

Ending protocol directive.

**Template and modes**

```
end_protocol
```

**Examples**

```
:- end_protocol.
```

**See also**

protocol/1-2
**include/1**

**Description**

```
include(File)
```

Includes a file contents, which must be valid terms, at the place of occurrence of the directive. The file can be specified as a relative path, an absolute path, or using library notation. If the file name have an extension, it must not be omitted. When using the reflection API, all file terms share the same line number as the directive.

This directive can be used as either a source file directive or an entity directive. As an entity directive, it can be used both in entities defined in source files and with the entity creation built-in predicates.

**Template and modes**

```
include(@source_file_name)
```

**Examples**

```prolog
:- include('raw_1.txt').

:- include('factbase.pl').

:- include('/home/me/databases/cities.pl').

?- create_object(cities, [], [public(city/4), include('/home/me/databases/cities.pl')], []).```

33
info/1

Description

Documentation directive for objects, protocols, and categories. The directive argument is a list of pairs using the format

*Key is Value*. See the documenting Logtalk programs section for a description of the valid keys.

Template and modes

```
info(+entity_info_list)
```

Examples

```
:- info([  
    version is 1.0,  
    author is 'Paulo Moura',  
    date is 2000/4/20,  
    comment is 'List protocol.'  
  ]).
```

See also

info/2
**initialization/1**

**Description**

`initialization(Goal)`

When used within an object, this directive defines a goal to be called immediately after the object has been loaded into memory. When used at a global level within a source file, this directive defines a goal to be called immediately after the compiled source file is loaded into memory.

**Template and modes**

`initialization(@callable)`

**Examples**

```prolog
:- initialization(init).
```
multifile

Description

multifile(Functor/Arity)
multifile((Functor1/Arity1, Functor2/Arity2, ...))
multifile([Functor1/Arity1, Functor2/Arity2, ...])

multifile(Entity::Functor/Arity)
multifile((Entity1::Functor1/Arity1, Entity2::Functor2/Arity2, ...))
multifile([Entity1::Functor1/Arity1, Entity2::Functor2/Arity2, ...])

multifile(Module:Functor/Arity)
multifile((Module1:Functor1/Arity1, Module2:Functor2/Arity2, ...))
multifile([Module1:Functor1/Arity1, Module2:Functor2/Arity2, ...])

Declares multifile predicates and multifile grammar rule non-terminals. The predicate (or non-terminal) must also be declared public in the object (or category) holding its primary declaration (i.e. the declaration without the Entity:: prefix). Protocols cannot declare multifile predicates as protocols cannot contain predicate definitions.

Template and modes

multifile(+predicate_indicator_term)
multifile(+non_terminal_indicator_term)
multifile(+object_identifier::+predicate_indicator_term)
multifile(+object_identifier::+non_terminal_indicator_term)
multifile(+category_identifier::+predicate_indicator_term)
multifile(+category_identifier::+non_terminal_indicator_term)
multifile(+module_identifier::+predicate_indicator_term)
multifile(+module_identifier::+non_terminal_indicator_term)

Examples

:- multifile(table/3).
:- multifile(user::hook/2).

```

See also

end_object/0
**protocol/1-2**

**Description**

```
protocol(Protocol)
protocol(Protocol, extends(Protocols))
```

Starting protocol directive.

**Template and modes**

```
protocol(+protocol_identifier)
protocol(+protocol_identifier, extends(+extended_protocols))
```

**Examples**

```
:- protocol(listp).
:- protocol(listp, extends(compoundp)).
:- protocol(queuep, extends(protected::listp)).
```

**See also**

`end_protocol/0`
threaded/0

Description

```
threaded
```

Declares that an object supports concurrent calls and asynchronous messages. Any object containing calls to the built-in multi-threading predicates (or importing a category that contains such calls) must include this directive.

Template and modes

```
threaded
```

Examples

```
:- threaded.
```
### alias/2

**Description**

| alias(Entity, PredicateAliases) |
| alias(Entity, NonTerminalAliases) |

Declares predicate and grammar rule non-terminal aliases. A predicate (non-terminal) alias is an alternative name for a predicate (non-terminal) declared or defined in an extended protocol, an implemented protocol, an extended category, an imported category, an extended prototype, an instantiated class, or a specialized class. Predicate aliases may be used to solve conflicts between imported or inherited predicates. It may also be used to give a predicate (non-terminal) a name more appropriated in its usage context. This directive may be used in objects, protocols, and categories.

Predicate (and non-terminal) aliases are specified using (preferably) the notation `Functor/Arity as Alias/Arity` or, in alternative, the notation `Functor/Arity::Alias/Arity`.

**Template and modes**

| alias(@entity_identifier, +list(predicate_indicator_alias)) |
| alias(@entity_identifier, +list(non_terminal_indicator_alias)) |

**Examples**

```prolog
:- alias(list, [member/2 as list_member/2]).
:- alias(set, [member/2 as set_member/2]).
:- alias(words, [singular//0 as peculiar//0]).
```
**coinductive/1**

**Description**

<table>
<thead>
<tr>
<th>coinductive(Functor/Arity)</th>
</tr>
</thead>
<tbody>
<tr>
<td>coinductive((Functor1/Arity1, Functor2/Arity2, ...))</td>
</tr>
<tr>
<td>coinductive([Functor1/Arity1, Functor2/Arity2, ...])</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>coinductive(Template)</th>
</tr>
</thead>
<tbody>
<tr>
<td>coinductive((Template1, Template2, ...))</td>
</tr>
<tr>
<td>coinductive([Template1, Template2, ...])</td>
</tr>
</tbody>
</table>

This is an experimental directive, used for declaring coinductive predicates. Requires a back-end Prolog compiler with minimal support for cyclic terms. The current implementation of coinduction allows the generation of only the basic cycles but all valid solutions should be recognized. Use a predicate indicator as argument when all the coinductive predicate arguments are relevant for coinductive success. Use a template when only some coinductive predicate arguments (represented by a "+") should be considered when testing for coinductive success (represent the arguments that should be disregarded by a "-"). It's possible to define local coinductive_success_hook/2 or coinductive_success_hook/1 predicates that are automatically called with the coinductive predicate term resulting from a successful unification with an ancestor goal as first argument. The second argument, when present, is the coinductive hypothesis (i.e. the ancestor goal) used. These hook predicates can provide an alternative to the use of tabling when defining some coinductive predicates. There is no overhead when these hook predicates are not defined.

This directive must precede any calls to the declared coinductive predicates.

**Template and modes**

<table>
<thead>
<tr>
<th>coinductive(+predicate_indicator_term)</th>
</tr>
</thead>
<tbody>
<tr>
<td>coinductive(+coinductive_predicate_template_term)</td>
</tr>
</tbody>
</table>

**Examples**

| := coinductive(comember/2). |
| := coinductive(controller(+,+,+,-,-)). |

**See also**

coinductive_success_hook/1-2
**discontiguous/1**

**Description**

\[
\text{discontiguous} \left\langle \text{Functor}/\text{Arity} \right\rangle \\
\text{discontiguous} \left\langle \left( \text{Functor}_1/\text{Arity}_1, \text{Functor}_2/\text{Arity}_2, \ldots \right) \right\rangle \\
\text{discontiguous} \left\langle \left[ \text{Functor}_1/\text{Arity}_1, \text{Functor}_2/\text{Arity}_2, \ldots \right] \right\rangle
\]

Declares discontiguous predicates and discontiguous grammar rule non-terminals. The use of this directive should be avoided as not all backend Prolog compilers support discontiguous predicates.

**Template and modes**

\[
\text{discontiguous} \left\langle +\text{predicate_indicator_term} \right\rangle \\
\text{discontiguous} \left\langle +\text{non_terminal_indicator_term} \right\rangle
\]

**Examples**

\[
:- \text{discontiguous(counter/1)}.
\]
\[
:- \text{discontiguous((lives/2, works/2))}.
\]
\[
:- \text{discontiguous([db/4, key/2, file/3])}.
\]
**dynamic/1**

**Description**

<table>
<thead>
<tr>
<th>dynamic(Functor/Arity)</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic((Functor1/Arity1, Functor2/Arity2, ...))</td>
</tr>
<tr>
<td>dynamic([Functor1/Arity1, Functor2/Arity2, ...])</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>dynamic(Entity::Functor/Arity)</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic((Entity1::Functor1/Arity1, Entity2::Functor2/Arity2, ...))</td>
</tr>
<tr>
<td>dynamic([Entity1::Functor1/Arity1, Entity2::Functor2/Arity2, ...])</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>dynamic(Module::Functor/Arity)</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic((Module1::Functor1/Arity1, Module2::Functor2/Arity2, ...))</td>
</tr>
<tr>
<td>dynamic([Module1::Functor1/Arity1, Module2::Functor2/Arity2, ...])</td>
</tr>
</tbody>
</table>

Declares dynamic predicates and dynamic grammar rule non-terminals. Note that an object can be static and have both static and dynamic predicates/non-terminals. Dynamic predicates cannot be declared as synchronized. When the dynamic predicates are local to an object, declaring them also as private predicates allows the Logtalk compiler to generated optimized code for asserting and retracting predicate clauses. Categories can also contain dynamic predicate directives but cannot contain clauses for dynamic predicates.

The predicate indicators (non-terminal indicators) can be explicitly qualified with an object identifier or a category identifier when the predicates (non-terminals) are also declared multifile.

Note that dynamic predicates cannot be declared synchronized (when necessary, declare the predicates updating the dynamic predicates as synchronized).
Template and modes

\[
\begin{align*}
dynamic(+\text{predicate\_indicator\_term}) \\
dynamic(+\text{non\_terminal\_indicator\_term}) \\
dynamic(+\text{object\_identifier}::+\text{predicate\_indicator\_term}) \\
dynamic(+\text{object\_identifier}::+\text{non\_terminal\_indicator\_term}) \\
dynamic(+\text{category\_identifier}::+\text{predicate\_indicator\_term}) \\
dynamic(+\text{category\_identifier}::+\text{non\_terminal\_indicator\_term}) \\
dynamic(+\text{module\_identifier}::+\text{predicate\_indicator\_term}) \\
dynamic(+\text{module\_identifier}::+\text{non\_terminal\_indicator\_term})
\end{align*}
\]

Examples

\[
\begin{align*}
&:= \text{dynamic(counter/1)}. \\
&:= \text{dynamic}((\text{lives/2}, \text{works/2})). \\
&:= \text{dynamic}([\text{db/4}, \text{key/2}, \text{file/3}]).
\end{align*}
\]

See also

\text{dynamic/0}
info/2

Description

```
info(Functor/Arity, List)
info(Functor//Arity, List)
```

Documentation directive for predicates and grammar rule non-terminals. The first argument is either a predicate indicator or a grammar rule non-terminal indicator. The second argument is a list of pairs using the format `Key is Value`. See the documenting Logtalk programs section for a description of the valid keys.

Template and modes

```
info(+predicate_indicator, +predicate_info_list)
info(+non_terminal_indicator, +predicate_info_list)
```

Examples

```
:- info(empty/1, [   
  comment is 'True if the argument is an empty list.',
  argnames is ['List']
]).

:- info(sentence//0, [   
  comment is 'Rewrites a sentence into a noun phrase and a verb phrase.'
]).
```

`info/1, mode/2`
**meta_predicate/1**

**Description**

| meta_predicate(MetaPredicateTemplate) |
| meta_predicate((MetaPredicateTemplate1, MetaPredicateTemplate2, ...)) |
| meta_predicate([MetaPredicateTemplate1, MetaPredicateTemplate2, ...]) |
| meta_predicate(Entity::MetaPredicateTemplate) |
| meta_predicate((Entity1::MetaPredicateTemplate1, Entity2::MetaPredicateTemplate2, ...)) |
| meta_predicate([Entity1::MetaPredicateTemplate1, Entity2::MetaPredicateTemplate2, ...]) |
| meta_predicate(Module:MetaPredicateTemplate) |
| meta_predicate((Module1:MetaPredicateTemplate1, Module2:MetaPredicateTemplate2, ...)) |
| meta_predicate([Module1:MetaPredicateTemplate1, Module2:MetaPredicateTemplate2, ...]) |

Declares meta-predicates, i.e., predicates that have arguments that will be called as goals. An argument may also be a closure instead of a goal if the meta-predicate uses the call/N Logtalk built-in methods to construct and call the actual goal from the closure and the additional arguments.

Meta-arguments which are goals are represented by the integer 0. Meta-arguments which are closures are represented by a positive integer, N, representing the number of additional arguments that will be appended to the closure in order to construct the corresponding meta-call. Normal arguments are represented by the atom *.

Logtalk allows the use of this directive to override the original meta-predicate directive. This is sometimes necessary when calling Prolog module meta-predicates due to the lack of standardization of the syntax of the meta-predicate templates.

**Template and modes**

| meta_predicate(+meta_predicate_template_term) |
| meta_predicate(+object_identifier::+meta_predicate_template_term) |
| meta_predicate(+category_identifier::+meta_predicate_template_term) |
| meta_predicate(+module_identifier:+meta_predicate_template_term) |

**Examples**

```prolog
:- meta_predicate(findall(*, 0, *)).
:- meta_predicate(forall(0, 0)).
:- meta_predicate(maplist(2, *, *)).
```

**See also**

meta_non_terminal/1
meta_non_terminal/1

Description

Declares meta-non-terminals, i.e., non-terminals that have arguments that will be called as non-terminals (or grammar rule bodies). An argument may also be a closure instead of a goal if the non-terminal uses the call/1-N Logtalk built-in methods to construct and call the actual non-terminal from the closure and the additional arguments.

Meta-arguments which are non-terminals are represented by the integer 0. Meta-arguments which are closures are represented by a positive integer, N, representing the number of additional arguments that will be appended to the closure in order to construct the corresponding meta-call. Normal arguments are represented by the atom *. Meta-arguments are always called in the meta-non-terminal calling context, not in the meta-non-terminal definition context.

Logtalk allows the use of this directive to override the original meta-non-terminal directive. This is sometimes necessary when calling Prolog module meta-non-terminals due to the lack of standardization of the syntax of the meta-non-terminal templates.

Template and modes

Examples

See also

meta_predicate/1
**mode/2**

**Description**

```
mode(Mode, NumberOfProofs)
```

Most predicates can be used with several instantiations modes. This directive enables the specification of each instantiation mode and the corresponding number of proofs (not necessarily distinct solutions). You may also use this directive for documenting grammar rule non-terminals. Multiple directives may be used to specify the same predicate or grammar rule non-terminal.

**Template and modes**

```
mode(+predicate_mode_term, +number_of_proofs)
mode(+non_terminal_mode_term, +number_of_proofs)
```

**Examples**

```
:- mode(atom_concat(-atom, -atom, +atom), one_or_more).
:- mode(atom_concat(+atom, +atom, -atom), one).
:- mode(var(@term), zero_or_one).
:- mode(solve(+callable, -list(atom)), zero_or_one).
```

**See also**

`info/2`
**op/3**

**Description**

\[
\text{op(Precedence, Associativity, Operator)}
\]

Declares operators. Operators declared inside entities have local scope. Global operators can be declared inside a source file by writing the respective directives before the entity opening directives.

**Template and modes**

\[
\text{op(+integer, +associativity, +atom_or_atom_list)}
\]

**Examples**

\[
\begin{align*}
\text{:- op}(200, \text{fy}, +). \\
\text{:- op}(200, \text{fy}, ?). \\
\text{:- op}(200, \text{fy}, @). \\
\text{:- op}(200, \text{fy}, -).
\end{align*}
\]

**See also**

current_op/3
private/1

Description

private(Functor/Arity)
private((Functor1/Arity1, Functor2/Arity2, ...))
private([Functor1/Arity1, Functor2/Arity2, ...])

Declares private predicates, private grammar rule non-terminals, and private operators. A private predicate can only be called from the object containing the private directive. A private non-terminal can only be used in a call of the phrase/2 and phrase/3 methods from the object containing the private directive.

Template and modes

private(+predicate_indicator_term)
private(+non_terminal_indicator_term)
private(+operator_declaration)

Examples

:- private(counter/1).
:- private((init/1, free/1)).
:- private([data/3, key/1, keys/1]).

See also

protected/1, public/1
protected/1

Description

\[
\text{protected}(\text{Functor}/\text{Arity})
\]
\[
\text{protected}((\text{Functor}_1/\text{Arity}_1, \text{Functor}_2/\text{Arity}_2, \ldots))
\]
\[
\text{protected}([\text{Functor}_1/\text{Arity}_1, \text{Functor}_2/\text{Arity}_2, \ldots])
\]
\[
\text{protected}(\text{Functor}/\text{Arity})
\]
\[
\text{protected}((\text{Functor}_1/\text{Arity}_1, \text{Functor}_2/\text{Arity}_2, \ldots))
\]
\[
\text{protected}([\text{Functor}_1/\text{Arity}_1, \text{Functor}_2/\text{Arity}_2, \ldots])
\]
\[
\text{protected}(\text{op}(\text{Precedence}, \text{Associativity}, \text{Operator}))
\]

Declares protected predicates, protected grammar rule non-terminals, and protected operators. A protected predicate can only be called from the object containing the directive or from an object that inherits the directive. A protected non-terminal can only be used as an argument in a \texttt{phrase/2} and \texttt{phrase/3} messages sent from the object containing the directive or from an object that inherits the directive. Protected operators are not inherited but declaring them provides useful information for defining descendant objects.

Template and modes

\[
\text{protected}(+\text{predicate}\_\text{indicator}\_\text{term})
\]
\[
\text{protected}(+\text{non}\_\text{terminal}\_\text{indicator}\_\text{term})
\]
\[
\text{protected}(+\text{operator}\_\text{declaration})
\]

Examples

\[
\text{:- protected(init/1).}
\]
\[
\text{:- protected((print/2, convert/4)).}
\]
\[
\text{:- protected([load/1, save/3]).}
\]

See also

\[
\text{private/1, public/1}
\]
public/1

Description

public(Functor/Arity)
public((Functor1/Arity1, Functor2/Arity2, ...))
public([Functor1/Arity1, Functor2/Arity2, ...])

public(Functor//Arity)
public((Functor1//Arity1, Functor2//Arity2, ...))
public([Functor1//Arity1, Functor2//Arity2, ...])

public(op(Precedence, Associativity, Operator))

Declares public predicates, public grammar rule non-terminals, and public operators. A public predicate can be called from any object. A public non-terminal can be used as an argument in phrase/2 and phrase/3 messages sent from any object. Public operators are not exported but declaring them provides useful information for defining client objects.

Template and modes

public(+predicate_indicator_term)
public(+non_terminal_indicator_term)
public(+operator_declaration)

Examples

:- public(ancestor/1).

:- public((instance/1, instances/1)).

:- public([leaf/1, leaves/1]).

See also

private/1, protected/1
synchronized/1

Description

\[
\begin{align*}
\text{synchronized} & \quad \text{(Functor/Arity)} \\
\text{synchronized} & \quad \text{(Functor1/Arity1, Functor2/Arity2, ...)} \\
\text{synchronized} & \quad \text{([Functor1/Arity1, Functor2/Arity2, ...])} \\
\end{align*}
\]

Declares synchronized predicates and synchronized grammar rule non-terminals. A synchronized predicate (or synchronized non-terminal) is protected by a mutex in order to allow for thread synchronization when proving a call to the predicate (or non-terminal). All predicates (and non-terminals) declared in the same synchronized directive share the same mutex. In order to use a separate mutex for each predicate (non-terminal) so that they are independently synchronized, a per-predicate synchronized directive must be used.

Declaring a predicate synchronized implicitly makes it deterministic. When using a single-threaded back-end Prolog compiler, calls to synchronized predicates behave as wrapped by the standard \text{once}/1 meta-predicate.

Note that synchronized predicates cannot be declared dynamic (when necessary, declare the predicates updating the dynamic predicates as synchronized).

Template and modes

\[
\begin{align*}
\text{synchronized(+predicate_indicator_term)} \\
\text{synchronized(+non_terminal_indicator_term)} \\
\end{align*}
\]

Examples

\[
\begin{align*}
\text{:- synchronized(db_update/1).} \\
\text{:- synchronized((write_stream/2, read_stream/2)).} \\
\text{:- synchronized([add_to_queue/2, remove_from_queue/2]).} \\
\end{align*}
\]
uses/2

Description

<table>
<thead>
<tr>
<th>uses(Object, Predicates)</th>
</tr>
</thead>
<tbody>
<tr>
<td>uses(Object, PredicatesAndAliases)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>uses(Object, NonTerminals)</th>
</tr>
</thead>
<tbody>
<tr>
<td>uses(Object, NonTerminalsAndAliases)</td>
</tr>
</tbody>
</table>

Declares that all calls (made from predicates defined in the category or object containing the directive) to the specified predicates are to be interpreted as messages to the specified object. Thus, this directive may be used to simplify writing of predicate definitions by allowing the programmer to omit the `Object::` prefix when using the predicates listed in the directive (as long as the predicate calls do not occur as arguments for non-standard Prolog meta-predicates not declared on the adapter files). It is also possible to include operator declarations, `op(Precedence, Associativity, Operator)`, in the second argument.

This directive is also used when compiling calls to the database and reflection built-in methods by looking into these methods predicate arguments.

It is possible to specify a predicate alias using the notation `Functor/Arity as Alias/Arity` or, in alternative, the notation `Functor/Arity::Alias/Arity`. Aliases may be used either for avoiding conflicts between predicates specified in `use_module/2` and `uses/2` directives or for giving more meaningful names considering the using context of the predicates.

To enable the use of static binding, and thus optimal message sending performance, the objects should be loaded before compiling the entities that call their predicates.

Template and modes

<table>
<thead>
<tr>
<th>uses(+object_identifier, +predicate_indicator_list)</th>
</tr>
</thead>
<tbody>
<tr>
<td>uses(+object_identifier, +predicate_indicator_alias_list)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>uses(+object_identifier, +non_terminal_indicator_list)</th>
</tr>
</thead>
<tbody>
<tr>
<td>uses(+object_identifier, +non_terminal_indicator_alias_list)</td>
</tr>
</tbody>
</table>

Examples

```prolog
:- uses(list, [append/3, member/2]).
:- uses(store, [data/2]).

foo :-

...,
findall(X, member(X, L), A), % the same as findall(X, list::member(X, L), A)
append(A, B, C), % the same as list::append(A, B, C)
assertz(data(X, C)), % the same as store::assertz(data(X, C))
...```

60
Another example, using the extended notation that allows us to define predicate aliases:

```prolog
:- uses(btrees, [new/1::new_btree/1]).
:- uses(queues, [new/1::new_queue/1]).

btree_to_queue :-
    ...,  % the same as btrees::new(Tree)
    new_btree(Tree),
    new_queue(Queue),  % the same as queues::new(Queue)
    ...
```

See also

use_module/2
use_module/2

Description

```
use_module(Module, Predicates)
```

This directive is supported only when using a back-end Prolog compiler that supports modules. It declares that all calls (made from predicates defined in the category or object containing the directive) to the specified predicates are to be interpreted as calls to explicitly-qualified module predicates. Thus, this directive may be used to simplify writing of predicate definitions by allowing the programmer to omit the `Module:` prefix when using the predicates listed in the directive (as long as the predicate calls do not occur as arguments for non-standard Prolog meta-predicates not declared on the adapter files). It is also possible to include operator declarations, `op(Precedence, Associativity, Operator)`, in the second argument.

This directive is also used when compiling calls to the database and reflection built-in methods by examining these methods predicate arguments.

It is possible to specify a predicate alias using the notation `Functor/Arity as Alias/Arity` or, in alternative, the notation `Functor/Arity:Alias/Arity`. Aliases may be used either for avoiding conflicts between predicates specified in `use_module/2` and `uses/2` directives or for giving more meaningful names considering the using context of the predicates.

Note that this directive differs from the directive with the same name found on some Prolog implementations by requiring the first argument to be a module name (an atom) instead of a file specification. In Logtalk, there’s no mixing between loading a resource and (declaring the) using (of) a resource. As a consequence, this directive doesn’t automatically load the module. Loading the module file is dependent of the used backend Prolog compiler and must be done separately (usually, using a source file `use_module/1` or `use_module/2` directive in the entity file or in the application loader file). Also note that the name of the module may differ from the name of the module file.

The modules should be loaded prior to the compilation of entities that call the module predicates. This is required in general to allow the compiler to check if the called module predicate is a meta-predicate and retrieve its meta-predicate template to ensure proper call compilation.

Template and modes

```
use_module(+module_identifier, +predicate_indicator_list)
```

Examples

```prolog
:- use_module(lists, [append/3, member/2]).
:- use_module(store, [data/2]).

foo :-
    ..., findall(X, member(X, L), A), % the same as findall(X, lists:member(X, L), A)
    append(A, B, C), % the same as lists:append(A, B, C)
    assertz(data(X, C)), % the same as assertz(store:data(X, C))
    ...
```

uses/2
Built-in predicates
current_category/1

Description

\texttt{current\_category(Category)}

Enumerates, by backtracking, all currently defined categories. All categories are found, either static, dynamic, or built-in.

Template and modes

\texttt{current\_category(?category\_identifier)}

Errors

Category is neither a variable nor a valid category identifier:

\texttt{type\_error(category\_identifier, Category)}

Examples

\begin{verbatim}
| ?- current\_category(monitoring).
\end{verbatim}

See also

abolish\_category/1, category\_property/2, create\_category/4
complements\_object/2, extends\_category/2-3, imports\_category/2-3
current_object/1

Description

current_object(Object)

Enumerates, by backtracking, all currently defined objects. All objects are found, either static, dynamic or built-in.

Template and modes

current_object(?object_identifier)

Errors

Object is neither a variable nor a valid object identifier:

type_error(object_identifier, Object)

Examples

| ?- current_object(list).

See also

abolish_object/1, create_object/4, object_property/2
extends_object/2-3, instantiates_class/2-3, specializes_class/2-3
**current_protocol/1**

**Description**

```prolog
current_protocol(Protocol)
```

Enumerates, by backtracking, all currently defined protocols. All protocols are found, either static, dynamic, or built-in.

**Template and modes**

```prolog
current_protocol(?protocol_identifier)
```

**Errors**

Protocol is neither a variable nor a valid protocol identifier:

```prolog
type_error(protocol_identifier, Protocol)
```

**Examples**

```
| ?- current_protocol(listp).
```

**See also**

abolish_protocol/1, create_protocol/3, protocol_property/2
conforms_to_protocol/2-3, extends_protocol/2-3, implements_protocol/2-3
category_property/2

Description

\texttt{category\_property(Category, Property)}

Enumerates, by backtracking, the properties associated with the defined categories. The valid category properties are listed in the language grammar.

Template and modes

\texttt{category\_property(?category\_identifier, ?category\_property)}

Errors

- Category is neither a variable nor a valid category identifier:
  \texttt{type\_error(category\_identifier, Category)}
- Property is neither a variable nor a callable term:
  \texttt{type\_error(callable, Property)}
- Property is a callable term but not a valid category property:
  \texttt{domain\_error(category\_property, Property)}

Examples

\begin{verbatim}
| ?- category_property(Category, dynamic).
\end{verbatim}

See also

abolish_category/1, create_category/4, current_category/2,
complements_object/2, extends_category/2-3, imports_category/2-3
**object_property/2**

**Description**

```
object_property(Object, Property)
```

Enumerates, by backtracking, the properties associated with the defined objects. The valid object properties are listed in the language grammar.

**Template and modes**

```
object_property(?object_identifier, ?object_property)
```

**Errors**

- Object is neither a variable nor a valid object identifier:
  ```
type_error(object_identifier, Object)
  ```
- Property is neither a variable nor a callable term:
  ```
type_error(callable, Property)
  ```
- Property is a callable term but not a valid object property:
  ```
domain_error(object_property, Property)
  ```

**Examples**

```
| ?- object_property(list, Property).
```

**See also**

protocol_property/2

Description

\texttt{protocol_property(Protocol, Property)}

Enumerates, by backtracking, the properties associated with the currently defined protocols. The valid protocol properties are listed in the language grammar.

Template and modes

\texttt{protocol_property(?protocol_identifier, ?protocol_property)}

Errors

- Protocol is neither a variable nor a valid protocol identifier: 
  \texttt{type_error(protocol_identifier, Protocol)}
- Property is neither a variable nor a callable term: 
  \texttt{type_error(callable, Property)}
- Property is a callable term but not a valid protocol property: 
  \texttt{domain_error(protocol_property, Property)}

Examples

| \?- protocol_property(listp, Property). |

See also

abolish_protocol/1, create_protocol/3, current_protocol/1
conforms_to_protocol/2-3, extends_protocol/2-3, implements_protocol/2-3
create_category/4

Description

create_category(Identifier, Relations, Directives, Clauses)

Creates a new, dynamic category. This predicate is often used as a primitive to implement high-level category creation methods.

When using Logtalk multi-threading features, predicates calling this built-in predicate may need to be declared synchronized in order to avoid race conditions.

Template and modes

create_category(?category_identifier, +list, +list, +list)

Errors

- Relations, Directives, or Clauses is a variable:
  - instantiation_error
- Identifier is neither a variable nor a valid category identifier:
  - type_error(category_identifier, Identifier)
- Identifier is already in use:
  - permission_error(replace, category, Identifier)
  - permission_error(replace, object, Identifier)
  - permission_error(replace, protocol, Identifier)
- Relations is neither a variable nor a proper list:
  - type_error(list, Relations)
- Directives is neither a variable nor a proper list:
  - type_error(list, Directives)
- Clauses is neither a variable nor a proper list:
  - type_error(list, Clauses)

Examples

| ?- create_category( |
| tolerances, |
| [implements(comparing)], |
| [], |
| [epsilon(1e-15), (equal(X, Y) :- epsilon(E), abs(X-Y) <= E)] |
| ) |  

See also

abolish_category/1, category_property/2, current_category/1
complements_object/2, extends_category/2-3, imports_category/2-3
create_object/4

Description

create_object(Identifier, Relations, Directives, Clauses)

Creates a new, dynamic object. The word object is used here as a generic term. This predicate can be used to create new prototypes, instances, and classes. This predicate is often used as a primitive to implement high-level object creation methods.

When using Logtalk multi-threading features, predicates calling this built-in predicate may need to be declared synchronized in order to avoid race conditions.

Template and modes

create_object(?object_identifier, +list, +list, +list)

Errors

- Relations, Directives, or Clauses is a variable:
  instantiation_error
- Identifier is neither a variable nor a valid object identifier:
  type_error(object_identifier, Identifier)
- Identifier is already in use:
  permission_error(replace, category, Identifier)
  permission_error(replace, object, Identifier)
  permission_error(replace, protocol, Identifier)
- Relations is neither a variable nor a proper list:
  type_error(list, Relations)
- Directives is neither a variable nor a proper list:
  type_error(list, Directives)
- Clauses is neither a variable nor a proper list:
  type_error(list, Clauses)

Examples

Creating a simple, stand-alone object (a prototype):

| ?- create_object(translator, [], [public(int/2)], [int(0, zero)]).

Creating a new prototype derived from a parent prototype:

| ?- create_object(mickey, [extends(mouse)], [public(alias/1)], [alias(mortimer)]).

Creating a new class instance:

| ?- create_object(p1, [instantiates(person)], [], [name('Paulo Moura'), age(42)]).
Creating a new class as a specialization of another class:

?- create_object(hovercraft, [specializes(vehicle)], [public([propeller/2, fan/2])], []).

Creating a new object and defining its initialization goal:

?- create_object(runner, [instantiates(runners)], [initialization(start)], [length(22), time(60)]).

Creating a new empty object with dynamic predicate declarations support:

?- create_object(database, [], [set_logtalk_flag(dynamic_declarations, allow)], []).

See also

abolish_object/1, current_object/1, object_property/2
extends_object/2-3, instantiates_class/2-3, specializes_class/2-3
create_protocol/3

Description

create_protocol(Identifier, Relations, Directives)

Creates a new, dynamic protocol. This predicate is often used as a primitive to implement high-level protocol creation methods.

When using Logtalk multi-threading features, predicates calling this built-in predicate may need to be declared synchronized in order to avoid race conditions.

Template and modes

create_protocol(?protocol_identifier, +list, +list)

Errors

Either Relations or Directives is a variable:
- instantiation_error
Identifier is neither a variable nor a valid protocol identifier:
- type_error(protocol_identifier, Identifier)
Identifier is already in use:
- permission_error(replace, category, Identifier)
- permission_error(replace, object, Identifier)
- permission_error(replace, protocol, Identifier)
Relations is neither a variable nor a proper list:
- type_error(list, Relations)
Directives is neither a variable nor a proper list:
- type_error(list, Directives)

Examples

| ?- create_protocol(
|  logging,
|  [extends(monitoring)],
|  [public([log_file/1, log_on/0, log_off/0])])
|).

abolish_category/1

Description

abolish_category(Category)

Removes from the database a dynamic category.

Template and modes

abolish_category(+category_identifier)

Errors

Category is a variable:
 instantiation_error

Category is neither a variable nor a valid category identifier:
 type_error(category_identifier, Category)

Category is an identifier of a static category:
 permission_error(modify, static_category, Category)

Category does not exist:
 existence_error(category, Category)

Examples

| ?- abolish_category(monitoring).

See also

category_property/2, create_category/4, current_category/1

abolish_protocol/1

Description

abolish_protocol(Protocol)

Removes from the database a dynamic protocol.

Template and modes

abolish_protocol(@protocol_identifier)

Errors

Protocol is a variable:
  instantiation_error
Protocol is neither a variable nor a valid protocol identifier:
  type_error(protocol_identifier, Protocol)
Protocol is an identifier of a static protocol:
  permission_error(modify, static_protocol, Protocol)
Protocol does not exist:
  existence_error(protocol, Protocol)

Examples

| ?- abolish_protocol(listp). |

See also

create_protocol/3, current_protocol/1, protocol_property/2
conforms_to_protocol/2-3, extends_protocol/2-3, implements_protocol/2-3
extends_object/2-3

Description

```
extends_object(Prototype, Parent)
extends_object(Prototype, Parent, Scope)
```

Enumerates, by backtracking, all pairs of objects such that the first one extends the second. The relation scope is represented by the atoms public, protected, and private.

Template and modes

```
extends_object(?object_identifier, ?object_identifier)
extends_object(?object_identifier, ?object_identifier, ?scope)
```

Errors

Prototype is neither a variable nor a valid object identifier:
```
type_error(object_identifier, Prototype)
```
Parent is neither a variable nor a valid object identifier:
```
type_error(object_identifier, Parent)
```
Scope is neither a variable nor an atom:
```
type_error(atom, Scope)
```
Scope is not a valid entity scope:
```
domain_error(scope, Scope)
```

Examples

| ?- extends_object(Object, state_space).
| ?- extends_object(Object, list, public).

current_object/1, instantiates_class/2-3, specializes_class/2-3
extends_protocol/2-3

Description

extends_protocol(Protocol1, Protocol2)
extends_protocol(Protocol1, Protocol2, Scope)

Enumerates, by backtracking, all pairs of protocols such that the first one extends the second. The relation scope is represented by the atoms public, protected, and private.

Template and modes

extends_protocol(?protocol_identifier, ?protocol_identifier)
extends_protocol(?protocol_identifier, ?protocol_identifier, ?scope)

Errors

Protocol1 is neither a variable nor a valid protocol identifier:
  type_error(protocol_identifier, Protocol1)
Protocol2 is neither a variable nor a valid protocol identifier:
  type_error(protocol_identifier, Protocol2)
Scope is neither a variable nor an atom:
  type_error(atom, Scope)
Scope is not a valid entity scope:
  domain_error(scope, Scope)

Examples

| ?- extends_protocol(listp, Protocol).

| ?- extends_protocol(Protocol, termp, private).

See also

current_protocol/1, implements_protocol/2-3, conforms_to_protocol/2-3
extends_category/2-3

Description

```
extends_category(Category1, Category2)
extends_category(Category1, Category2, Scope)
```

Enumerates, by backtracking, all pairs of categories such that the first one extends the second. The relation scope is represented by the atoms `public`, `protected`, and `private`.

Template and modes

```
extends_category(?category_identifier, ?category_identifier)
nextends_category(?category_identifier, ?category_identifier, ?scope)
```

Errors

- Category1 is neither a variable nor a valid protocol identifier:
  `type_error(category_identifier, Category1)`
- Category2 is neither a variable nor a valid protocol identifier:
  `type_error(category_identifier, Category2)`
- Scope is neither a variable nor an atom:
  `type_error(atom, Scope)`
- Scope is not a valid entity scope:
  `domain_error(scope, Scope)`

Examples

```
| ?- extends_category(basic, Category). 
| ?- extends_category(Category, extended, private).
```

**implements_protocol/2-3**

**Description**

Implements protocol\(\text{Object, Protocol})\),\(\text{implements_protocol(Category, Protocol)}\),\(\text{implements_protocol(Object, Protocol, Scope)}\),\(\text{implements_protocol(Category, Protocol, Scope)}\)

Enumerates, by backtracking, all pairs of entities such that an object or a category implements a protocol. The relation scope is represented by the atoms public, protected, and private. This predicate only returns direct implementation relations; it does not implement a transitive closure.

**Template and modes**

\(\text{implements_protocol(?object_identifier, ?protocol_identifier)}\)
\(\text{implements_protocol(?category_identifier, ?protocol_identifier)}\)
\(\text{implements_protocol(?object_identifier, ?protocol_identifier, ?scope)}\)
\(\text{implements_protocol(?category_identifier, ?protocol_identifier, ?scope)}\)

**Errors**

Object is neither a variable nor a valid object identifier:
\(\text{type_error(object_identifier, Object)}\)

Category is neither a variable nor a valid category identifier:
\(\text{type_error(category_identifier, Category)}\)

Protocol is neither a variable nor a valid protocol identifier:
\(\text{type_error(protocol_identifier, Protocol)}\)

Scope is neither a variable nor an atom:
\(\text{type_error(atom, Scope)}\)

Scope is not a valid entity scope:
\(\text{domain_error(scope, Scope)}\)

**Examples**

\(| ?- \text{implements_protocol(list, listp).} |\)
\(| ?- \text{implements_protocol(list, listp, public).} |\)

**See also**

current_protocol/1, conforms_to_protocol/2-3
**imports_category/2-3**

**Description**

\[
\text{imports_category(Object, Category)} \\
\text{imports_category(Object, Category, Scope)}
\]

Enumerates, by backtracking, importation relations between objects and categories. The relation scope is represented by the atoms `public`, `protected`, and `private`.

**Template and modes**

\[
\text{imports_category(?object_identifier, ?category_identifier)} \\
\text{imports_category(?object_identifier, ?category_identifier, ?scope)}
\]

**Errors**

Object is neither a variable nor a valid object identifier:

\[
\text{type_error(object_identifier, Object)}
\]

Category is neither a variable nor a valid category identifier:

\[
\text{type_error(category_identifier, Category)}
\]

Scope is neither a variable nor an atom:

\[
\text{type_error(.atom, Scope)}
\]

Scope is not a valid entity scope:

\[
\text{domain_error(scope, Scope)}
\]

**Examples**

\[
| ?- \text{imports_category(debugger, monitoring)}. \\
| ?- \text{imports_category(Object, monitoring, protected)}. 
\]

**See also**

current_category/1 complements_object/2
instantiates_class/2-3

Description

\[\text{instantiates_class(Instance, Class)}\]
\[\text{instantiates_class(Instance, Class, Scope)}\]

Enumerates, by backtracking, all pairs of objects such that the first one instantiates the second. The relation scope is represented by the atoms \texttt{public}, \texttt{protected}, and \texttt{private}.

Template and modes

\[\text{instantiates_class(?object_identifier, ?object_identifier)}\]
\[\text{instantiates_class(?object_identifier, ?object_identifier, ?scope)}\]

Errors

- Instance is neither a variable nor a valid object identifier:
  \[\text{type_error(object_identifier, Instance)}\]
- Class is neither a variable nor a valid object identifier:
  \[\text{type_error(object_identifier, Class)}\]
- Scope is neither a variable nor an atom:
  \[\text{type_error(atom, Scope)}\]
- Scope is not a valid entity scope:
  \[\text{domain_error(scope, Scope)}\]

Examples

\[
\begin{align*}
| & \text{- instantiates_class(water_jug, state_space).} \\
| & \text{- instantiates_class(Space, state_space, public).}
\end{align*}
\]

See also

\texttt{current_object/1, extends_object/2-3, specializes_class/2-3}
specializes_class/2-3

Description

specializes_class(Class, Superclass)
specializes_class(Class, Superclass, Scope)

Enumerates, by backtracking, all pairs of objects such that the first one specializes the second. The relation scope is represented by the atoms public, protected, and private.

Template and modes

specializes_class(?object_identifier, ?object_identifier)
specializes_class(?object_identifier, ?object_identifier, ?scope)

Errors

Class is neither a variable nor a valid object identifier:
    type_error(object_identifier, Class)
Superclass is neither a variable nor a valid object identifier:
    type_error(object_identifier, Superclass)
Scope is neither a variable nor an atom:
    type_error(atom, Scope)
Scope is not a valid entity scope:
    domain_error(scope, Scope)

Examples

| ?- specializes_class(Subclass, state_space).
| ?- specializes_class(Subclass, state_space, public).

See also

current_object/1, extends_object/2-3, instantiates_class/2-3
complements_object/2

Description

\[
\text{complements_object}(\text{Category}, \text{Object})
\]

Enumerates, by backtracking, all category–object pairs such that the category explicitly complements the object.

Template and modes

\[
\text{complements_object}(\text{?category_identifier}, \text{?object_identifier})
\]

Errors

- Category is neither a variable nor a valid category identifier:
  \[
  \text{type_error}(\text{category_identifier}, \text{Prototype})
  \]
- Object is neither a variable nor a valid object identifier:
  \[
  \text{type_error}(\text{object_identifier}, \text{Parent})
  \]

Examples

\[
| \text{?- complements_object(logging, employee)}. |
\]

See also

current_category/1, imports_category/2–3
conforms_to_protocol/2-3

Description

conforms_to_protocol(Object, Protocol)
conforms_to_protocol(Category, Protocol)

conforms_to_protocol(Object, Protocol, Scope)
conforms_to_protocol(Category, Protocol, Scope)

Enumerates, by backtracking, all pairs of entities such that an object or a category conforms to a protocol. The relation scope is represented by the atoms public, protected, and private. This predicate implements a transitive closure for the protocol implementation relation.

Template and modes

conforms_to_protocol(?object_identifier, ?protocol_identifier)
conforms_to_protocol(?category_identifier, ?protocol_identifier)

conforms_to_protocol(?object_identifier, ?protocol_identifier, ?scope)
conforms_to_protocol(?category_identifier, ?protocol_identifier, ?scope)

Errors

Object is neither a variable nor a valid object identifier:
  type_error(object_identifier, Object)
Category is neither a variable nor a valid category identifier:
  type_error(category_identifier, Category)
Protocol is neither a variable nor a valid protocol identifier:
  type_error(protocol_identifier, Protocol)
Scope is neither a variable nor an atom:
  type_error(atom, Scope)
Scope is not a valid entity scope:
  domain_error(scope, Scope)

Examples

| ?- conforms_to_protocol(list, listp). |
| ?- conforms_to_protocol(list, listp, public). |

See also

current_protocol/1, implements_protocol/2-3
abolish_events/5

Description

abolish_events(Event, Object, Message, Sender, Monitor)

Abolishes all matching events. The two types of events are represented by the atoms before and after.

Template and modes

abolish_events(@term, @term, @term, @term, @term)

Errors

Event is neither a variable nor a valid event identifier:
  type_error(event, Event)
Object is neither a variable nor a valid object identifier:
  type_error(object_identifier, Object)
Message is neither a variable nor a callable term:
  type_error(callable, Message)
Sender is neither a variable nor a valid object identifier:
  type_error(object_identifier, Sender)
Monitor is neither a variable nor a valid object identifier:
  type_error(object_identifier, Monitor)

Examples

| ?- abolish_events(_, list, _, _, debugger).

See also

current_event/5, define_events/5
before/3, after/3
current_event/5

Description

current_event(Event, Object, Message, Sender, Monitor)

Enumerates, by backtracking, all defined events. The two types of events are represented by the atoms before and after.

Template and modes

Errors

Event is neither a variable nor a valid event identifier:
  type_error(event, Event)
Object is neither a variable nor a valid object identifier:
  type_error(object_identifier, Object)
Message is neither a variable nor a callable term:
  type_error(callable, Message)
Sender is neither a variable nor a valid object identifier:
  type_error(object_identifier, Sender)
Monitor is neither a variable nor a valid object identifier:
  type_error(object_identifier, Monitor)

Examples

| ?- current_event(Event, Object, Message, Sender, debugger).

See also

abolish_events/5, define_events/5
before/3, after/3
define_events/5

Description

```
define_events(Event, Object, Message, Sender, Monitor)
```

Defines a new set of events. The two types of events are represented by the atoms `before` and `after`. The object `Monitor` must define the event handler methods required by the `Event` argument.

Template and modes

```
define_events(@term, @term, @term, @term, +object_identifier)
```

Errors

- Event is neither a variable nor a valid event identifier:
  ```
  type_error(event, Event)
  ```
- Object is neither a variable nor a valid object identifier:
  ```
  type_error(object_identifier, Object)
  ```
- Message is neither a variable nor a callable term:
  ```
  type_error(callable, Message)
  ```
- Sender is neither a variable nor a valid object identifier:
  ```
  type_error(object_identifier, Sender)
  ```
- Monitor is a variable:
  ```
  instantiation_error
  ```
- Monitor is neither a variable nor a valid object identifier:
  ```
  existence_error(object_identifier, Monitor)
  ```
- Monitor does not define the required `before/3` method:
  ```
  existence_error(procedure, before/3)
  ```
- Monitor does not define the required `after/3` method:
  ```
  existence_error(procedure, after/3)
  ```

Examples

```
| :- define_events(_, list, member(_, _), _, debugger).
```

See also

abolish_events/5, current_event/5
before/3, after/3
**threaded/1**

**Description**

\[
\text{threaded(Goals)}
\]
\[
\text{threaded(Conjunction)}
\]
\[
\text{threaded(Disjunction)}
\]

Proves each goal in a conjunction (disjunction) of goals in its own thread. This predicate is deterministic and opaque to cuts. The predicate argument is **not** flattened.

When the argument is a conjunction of goals, a call to this predicate blocks until either all goals succeed, one of the goals fail, or one of the goals generate an exception; the failure of one of the goals or an exception on the execution of one of the goals results in the termination of the remaining threads. The predicate call is true **iff** all goals are true.

When the argument is a disjunction of goals, a call to this predicate blocks until either one of the goals succeeds, all the goals fail, or one of the goals generate an exception; the success of one of the goals or an exception on the execution of one of the goals results in the termination of the remaining threads. The predicate call is true **iff** one of the goals is true.

When the predicate argument is neither a conjunction not a disjunction of goals, no threads are used. In this case, the predicate call is equivalent to a **once/1** predicate call.

**Template and modes**

\[
\text{threaded(+callable)}
\]

**Errors**

Goals is a variable:

\[\text{instantiation_error}\]

A goal in Goals is a variable:

\[\text{instantiation_error}\]

Goals is neither a variable nor a callable term:

\[\text{type_error(callable, Goals)}\]

A goal Goal in Goals is neither a variable nor a callable term:

\[\text{type_error(callable, Goal)}\]

**Examples**

Prove a conjunction of goals, each one in its own thread:

\[
\text{threaded((Goal, Goals))}
\]

Prove a disjunction of goals, each one in its own thread:

\[
\text{threaded((Goal; Goals))}
\]

**See also**

threaded_call/1-2, threaded_exit/1-2, threaded_ignore/1, threaded_once/1-2, threaded.peek/1-2
threaded_call/1-2

Description

threaded_call(Goal)
threaded_call(Goal, Tag)

Proves Goal asynchronously using a new thread. The argument can be a message sending goal. Calls to this predicate always succeeds and return immediately. The results (success, failure, or exception) are sent back to the message queue of the object containing the call (this); they can be retrieved by calling the threaded_exit/1 predicate.

The variant threaded_call/2 returns a threaded call identifier tag that can be used with the threaded_exit/2 predicate. Tags shall be regarded as an opaque term; users shall not rely on its type.

Template and modes

threaded_call(@callable)
threaded_call(@callable, -nonvar)

Errors

- Goal is a variable:
  instantiation_error
- Goal is neither a variable nor a callable term:
  type_error(callable, Goal)
- Tag is not a variable:
  type_error(variable, Goal)

Examples

Prove Goal asynchronously in a new thread:
  threaded_call(Goal)
Prove ::Message asynchronously in a new thread:
  threaded_call(::Message)
Prove Object::Message asynchronously in a new thread:
  threaded_call(Object::Message)

See also

threaded_exit/1-2, threaded_ignore/1, threaded_once/1-2, threaded.peek/1-2, threaded/1
threaded_once/1-2

Description

| threaded_once(Goal)  
| threaded_once(Goal, Tag) |

Proves Goal asynchronously using a new thread. Only the first goal solution is found. The argument can be a message sending goal. This call always succeeds. The result (success, failure, or exception) is sent back to the message queue of the object containing the call (this).

The variant threaded_once/2 returns a threaded call identifier tag that can be used with the threaded_exit/2 predicate. Tags shall be regarded as an opaque term; users shall not rely on its type.

Template and modes

| threaded_once(@callable)  
| threaded_once(@callable, -nonvar) |

Errors

- Goal is a variable:
  instantiation_error
- Goal is neither a variable nor a callable term:
  type_error(callable, Goal)
- Tag is not a variable:
  type_error(variable, Goal)

Examples

- Prove Goal asynchronously in a new thread:
  threaded_once(Goal)
- Prove ::Message asynchronously in a new thread:
  threaded_once(::Message)
- Prove Object::Message asynchronously in a new thread:
  threaded_once(Object::Message)

See also

threaded_call/1-2, threaded_exit/1-2, threaded_ignore/1, threaded_peek/1-2, threaded/1
**threaded_ignore/1**

**Description**

```
threaded_ignore(Goal)
```

Proves `Goal` asynchronously using a new thread. Only the first goal solution is found. The argument can be a message sending goal. This call always succeeds, independently of the result (success, failure, or exception), which is simply discarded instead of being sent back to the message queue of the object containing the call (`this`).

**Template and modes**

```
threaded_ignore(@callable)
```

**Errors**

- Goal is a variable:
  - `instantiation_error`
- Goal is neither a variable nor a callable term:
  - `type_error(callable, Goal)`

**Examples**

- Prove `Goal` asynchronously in a new thread:
  ```
  threaded_ignore(Goal)
  ```
- Prove `::Message` asynchronously in a new thread:
  ```
  threaded_ignore(::Message)
  ```
- Prove `Object::Message` asynchronously in a new thread:
  ```
  threaded_ignore(Object::Message)
  ```

**See also**

`threaded_call/1-2, threaded_exit/1-2, threaded_once/1-2, threaded_pEEK/1-2, threaded/1`
threaded_exit/1-2

Description

threaded_exit(Goal)
threaded_exit(Goal, Tag)

Retrieves the result of proving Goal in a new thread. This predicate blocks execution until the reply is sent to the this message queue by the thread executing the goal. When there is no thread proving the goal, the predicate generates an exception. This predicate is non-deterministic, providing access to any alternative solutions of its argument.

The argument of this predicate should be a variant of the argument of the corresponding threaded_call/1 call. When the predicate argument is subsumed by the threaded_call/1 call argument, the threaded_exit/1 call will succeed iff its argument is a solution of the (more general) goal.

The variant threaded_exit/2 accepts a threaded call identifier tag generated by the calls to the threaded_call/2 and threaded_once/2 predicates. Tags shall be regarded as an opaque term; users shall not rely on its type.

Template and modes

threaded_exit(+callable)
threaded_exit(+callable, +nonvar)

Errors

Goal is a variable:
instantiation_error
Goal is neither a variable nor a callable term:
type_error(callable, Goal)
no thread is running for proving Goal:
existence_error(goal_thread, Goal)
Tag is a variable:
instantiation_error

Examples

To retrieve an asynchronous goal proof result:
threaded_exit(Goal)
To retrieve an asynchronous message to self result:
threaded_exit(::Goal)
To retrieve an asynchronous message result:
threaded_exit(Object::Goal)

See also

threaded_call/1-2, threaded_ignore/1, threaded_once/1-2, threaded.peek/1-2, threaded/1
threaded_peek/1-2

Description

Checks if the result of proving Goal in a new thread is already available. This call succeeds or fails without blocking execution waiting for a reply to be available.

The argument of this predicate should be a variant of the argument of the corresponding threaded_call/1 call. When the predicate argument is subsumed by the threaded_call/1 call argument, the threaded_peek/1 call will succeed iff its argument unifies with an already available solution of the (more general) goal.

The variant threaded_peek/2 accepts a threaded call identifier tag generated by the calls to the threaded_call/2 and threaded_once/2 predicates. Tags shall be regarded as an opaque term; users shall not rely on its type.

Template and modes

threaded_peek(+callable)
threaded_peek(+callable, +nonvar)

Errors

- Goal is a variable:
  instantiation_error
- Goal is neither a variable nor a callable term:
  type_error(callable, Goal)
- Tag is a variable:
  instantiation_error

Examples

To check for an asynchronous goal proof result:
  threaded_peek(Goal)
To check for an asynchronous message to self result:
  threaded_peek(::Goal)
To check for an asynchronous message result:
  threaded_peek(Object::Goal)

See also

threaded_call/1-2, threaded_exit/1-2, threaded_ignore/1, threaded_once/1-2
threaded/1
threaded_wait/1

Description

threaded_wait(Term)
threaded_wait([Term| Terms])

Suspends the thread making the call until a notification is received that unifies with Term. The call must be made within the same object (this) containing the calls to the threaded_notify/1 predicate that will eventually send the notification. The argument may also be a list of notifications, [Term| Terms]. In this case, the thread making the call will suspend until all notifications in the list are received.

Template and modes

threaded_wait(?term)
threaded_wait(+list(term))

Errors

(none)

Examples

Wait until the data_available notification is received:

threaded_wait(data_available)

See also

threaded_notify/1
threaded_notify/1

Description

```
threaded_notify(Term)
threaded_notify([Term| Terms])
```

Sends `Term` as a notification to any thread suspended waiting for it in order to proceed. The call must be made within the same object (`this`) containing the calls to the `threaded_wait/1` predicate waiting for the notification. The argument may also be a list of notifications, `[Term| Terms]`. In this case, all notifications in the list will be sent to any threads suspended waiting for them in order to proceed.

Template and modes

```
threaded_notify(@term)
threaded_notify(@list(term))
```

Errors

`(none)`

Examples

Send the notification `data_available`:

```
threaded_notify(data_available)
```

See also

`threaded_wait/1`
**logtalk Compile/1**

**Description**

logtalk Compile(File)
logtalk Compile(Files)

Compiles to disk a source file or a list of source files using the default compiler flags specified in the Logtalk adapter file. The Logtalk source file name extension (by default, .lgt) can be omitted. Source file paths can be absolute, relative to the current directory, or use library notation. This predicate can also be used to compile Prolog source files as Logtalk source code. When no recognized Logtalk or Prolog extension is specified, the compiler tries first to append a Logtalk source file extension and then a Prolog source file extension. If that fails, the compiler tries to use the file name as-is.

Note that only the errors related to problems in the predicate argument are listed below. This predicate fails when errors are found during compilation of a source file.

**Template and modes**

logtalk Compile(@source_file_name)
logtalk Compile(@list(source_file_name))

**Errors**

File is a variable:
instantiation_error
Files is a variable or a list with an element which is a variable:
instantiation_error
File, or an element File of the Files list, is neither a variable nor a source file:
type_error(source_file_name, File)
File, or an element File of the Files list, uses library notation but the library does not exist:
existence_error(library, Library)
File or an element File of the Files list does not exist:
existence_error(file, File)

**Examples**

| ?- logtalk Compile(set). |
| ?- logtalk Load(types(tree)). |
| ?- logtalk Compile([listp, list]). |

**See also**

logtalk Compile/2, logtalk Load/1, logtalk Load/2, logtalk Make/0, logtalk Make/1
logtalk Library Path/2
**logtalk_compile/2**

**Description**

Compiles to disk a source file or a list of source files using a list of compiler flags. The Logtalk source file name extension (by default, .lgt) can be omitted. Source file paths can be absolute, relative to the current directory, or use library notation. This predicate can also be used to compile Prolog source files as Logtalk source code. When no recognized Logtalk or Prolog extension is specified, the compiler tries first to append a Logtalk source file extension and then a Prolog source file extension. If that fails, the compiler tries to use the file name as-is. Compiler flags are represented as flag(value). For a description of the available compiler flags, please consult the User Manual.

Note that only the errors related to problems in the predicate argument are listed below. This predicate fails when errors are found during compilation of a source file.

**Template and modes**

```prolog
template(logtalk_compile) is 2.

logtalk_compile(File, Flags)
logtalk_compile(Files, Flags)
```

**Errors**

- File is a variable:
  - instantiation_error
- Files is a variable or a list with an element which is a variable:
  - instantiation_error
- File, or an element File of the Files list, is neither a variable nor a source file name:
  - type_error(source_file_name, File)
- File, or an element File of the Files list, uses library notation but the library does not exist:
  - existence_error(library, Library)
- File or an element File of the Files list, does not exist:
  - existence_error(file, File)
- Flags is a variable or a list with an element which is a variable:
  - instantiation_error
- Flags is neither a variable nor a proper list:
  - type_error(list, Flags)
- An element Flag of the Flags list is not a valid compiler flag:
  - type_error(compiler_flag, Flag)
- An element Flag of the Flags list defines a value for a read-only compiler flag:
  - permission_error(modify, flag, Flag)
- An element Flag of the Flags list defines an invalid value for a flag:
  - domain_error(flag_value, Flag+Value)
Examples

| ?- logtalk_compile_1(list, []). |
| ?- logtalk_compile_1(types(tree)). |
| ?- logtalk_compile_1([listp, list], [source_data(off), portability(silent)]). |

See also

logtalk_compile/1, logtalk_load/1, logtalk_load/2, logtalk_make/0, logtalk_make/1
logtalk_library_path/2
logtalk_load/1

Description

logtalk_load(File)
logtalk_load(Files)

Compiles to disk and then loads to memory a source file or a list of source files using the default compiler flags specified in the Logtalk adapter file. The Logtalk source file name extension (by default, .lgt) can be omitted. Source file paths can be absolute, relative to the current directory, or use library notation. This predicate can also be used to compile Prolog source files as Logtalk source code. When no recognized Logtalk or Prolog extension is specified, the compiler tries first to append a Logtalk source file extension and then a Prolog source file extension. If that fails, the compiler tries to use the file name as-is.

Note that only the errors related to problems in the predicate argument are listed below. This predicate fails when errors are found during compilation of a source file.

Depending on the back-end Prolog compiler, the notation {File} may be used in alternative (check the adapter files for its availability).

Template and modes

logtalk_load(@source_file_name)
logtalk_load(@list(source_file_name))

Errors

File is a variable:
instantiation_error
Files is a variable or a list with an element which is a variable:
instantiation_error
File, or an element File of the Files list, is neither a variable nor a source file name:
type_error(source_file_name, File)
File, or an element File of the Files list, uses library notation but the library does not exist:
existence_error(library, Library)
File or an element File of the Files list, does not exist:
existence_error(file, File)

Examples

| ?- logtalk_load(set).
| ?- logtalk_load(types(tree)).
| ?- logtalk_load([listp, list]).

See also

- An element Flag of the Flags list is not a valid compiler flag: \text{type_error(compiler_flag, Flag)}
- An element Flag of the Flags list defines a value for a read-only compiler flag: \text{permission_error(modify, flag, Flag)}
- An element Flag of the Flags list defines an invalid value for a flag: \text{domain_error(flag_value, Flag+Value)}
Examples

?- logtalk_load(list, []).  
?- logtalk_load(types(tree)).  
?- logtalk_load([listp, list], [source_data(off), portability(silent)]).

See also

logtalk_compile/1, logtalk_compile/2, logtalk_load/1, logtalk_make/0, logtalk_make/1  
logtalk_library_path/2
logtalk_make/0

Description

logtalk_make

Reloads all Logtalk source files that have been modified since the time they are last loaded. Only source files loaded using the \texttt{logtalk\_load/1-2} predicates are reloaded. Non-modified files will also be reloaded when there is a change to the compilation mode (i.e. when the files were loaded without explicit \texttt{debug/1} or \texttt{optimize/1} flags and the default values of these flags changed after loading; no check is made, however, for other implicit compiler flags that may have changed since loading).

Template and modes

\begin{verbatim}
logtalk_make
\end{verbatim}

Errors

\begin{verbatim}
none
\end{verbatim}

Examples

\begin{verbatim}
?- logtalk_make.
\end{verbatim}

See also

\begin{verbatim}
logtalk\_compile/1, logtalk\_compile/2, logtalk\_load/1, logtalk\_load/2, logtalk\_make/1
\end{verbatim}
**logtalk_make/1**

**Description**

```
logtalk_make(Target)
```

Allows reloading all Logtalk source files that have been modified since last loaded when called with the target `all` and deleting all intermediate files generated by the compilation of Logtalk source files when called with the target `clean`.

When using the `all` target, only source files loaded using the `logtalk_load/1-2` predicates are reloaded. Non-modified files will also be reloaded when there is a change to the compilation mode (i.e. when the files were loaded without explicit `debug/1` or `optimize/1` flags and the default values of these flags changed after loading; no check is made, however, for other implicit compiler flags that may have changed since loading).

**Template and modes**

```
logtalk_make(+atom)
```

**Errors**

*(none)*

**Examples**

```
?- logtalk_make(clean).
```

**See also**

`logtalk_compile/1`, `logtalk_compile/2`, `logtalk_load/1`, `logtalk_load/2`, `logtalk_make/0`
logtalk_library_path/2

Description

```
logtalk_library_path(Library, Path)
```

Dynamic and multifile user-defined predicate, allowing the declaration of aliases to library paths. Library aliases may also be used on the second argument (using the notation `alias(path)`). Paths must always end with the path directory separator character (`/`).

Relative paths (e.g. `../` or `./`) should only be used within the `alias(path)` notation so that library paths can always be expanded to absolute paths independently of the (usually unpredictable) current directory at the time the `logtalk_library_path/2` predicate is called.

When working with a relocatable application, the actual application installation directory can be retrieved by calling the `logtalk_load_context/2` predicate with the `directory` key and using the returned value to define the `logtalk_library_path/2` predicate. On a settings file, simply use an `initialization/1` directive to wrap the call to the `logtalk_load_context/2` predicate and the assert of the `logtalk_library_path/2` fact.

Template and modes

```
logtalk_library_path(?atom, -atom)
logtalk_library_path(?atom, -compound)
```
Errors

(none)

Examples

| ?- logtalk_library_path(viewpoints, Path).
Path = examples('viewpoints/')
yes

| ?- logtalk_library_path(Library, Path).
Library = home,
Path = '$HOME/' ;

Library = logtalk_home,
Path = '$LOGTALKHOME/' ;

Library = logtalk_user
Path = '$LOGTALKUSER/' ;

Library = examples
Path = logtalk_user('examples/') ;

Library = library
Path = logtalk_user('library/') ;

Library = viewpoints
Path = examples('viewpoints/')
yes

See also

logtalk_compile/1, logtalk_compile/2, logtalk_load/1, logtalk_load/2
logtalk_load_context/2

Description

logtalk_load_context(Key, Value)

Provides access to the Logtalk compilation/loading context. The following keys are currently supported: entity_identifier, entity_prefix, entity_type (returns the value module when compiling a module as an object), source, file (same as source), basename, directory, stream, target (the full path of the intermediate Prolog file), flags (the list of the explicit flags used for the compilation of the source file), term_position (Start-End), and variable_names ([Name=Variable1, ...]). The term_position key is only supported in back-end Prolog compilers that provide access to the start and end lines of a read term.

The source, file, basename, directory, target, and flags keys can also be used in calls to the logtalk_load_context/2 predicate wrapped in initialization/1 directives.

The term_position and variable_names keys are only meaningful when the logtalk_load_context/2 predicate is called from the term_expansion/2 predicate. Due to the goal-expansion phase occurring at a later compiler stage, the information provided by these two keys is no longer available at that time.

Using the variable_names key requires calling the standard built-in predicate term_variables/2 on the term read and unifying the term variables with the variables in the names list. This, however, rises portability issues with those Prolog compilers that don't return the variables in the same order for the term_variables/2 predicate and the option variable_names/1 of the read_term/3 built-in predicate, which is used by the Logtalk compiler to read source files.

Template and modes

logtalk_load_context(?atom, -nonvar)
Errors

(none)

Examples

| ?- logtalk_load_context(entity_identifier, Name).
  Name = list
  yes

| ?- logtalk_load_context(source, Source).
  Source = '/Users/me/project/library/list.lgt'

| ?- logtalk_load_context(basename, Basename).
  Basename = 'list.lgt'

| ?- logtalk_load_context(directory, Directory).
  Directory = '/Users/me/project/library/'
  yes

See also

goal_expansion/2, term_expansion/2
**current_logtalk_flag/2**

**Description**

```
current_logtalk_flag(Flag, Value)
```

Enumerates, by backtracking, the current Logtalk flag values.

**Template and modes**

```
current_logtalk_flag(?atom, ?atom)
```

**Errors**

- Flag is neither a variable nor an atom:
  `type_error(atom, Flag)`
- Flag is not a valid flag:
  `domain_error(flag, Value)`

**Examples**

```
| ?- current_logtalk_flag(xml, Value).
```

**See also**

`create_logtalk_flag/3`, `set_logtalk_flag/2`
**set_logtalk_flag/2**

**Description**

```prolog
cset_logtalk_flag(Flag, Value)
```

Sets Logtalk default, global, flag values. For local flag scope, use the corresponding `set_logtalk_flag/2` directive. To set a global flag value when compiling and loading a source file, wrap the calls to this built-in predicate with an `initialization/1` directive.

**Template and modes**

```prolog
cset_logtalk_flag(+atom, +nonvar)
```

**Errors**

- Flag is a variable:
  - `instantiation_error`
- Value is a variable:
  - `instantiation_error`
- Flag is not an atom:
  - `type_error(atom, Flag)`
- Flag is neither a variable nor a valid flag:
  - `domain_error(flag, Flag)`
- Value is not a valid value for flag Flag:
  - `domain_error(flag_value, Flag + Value)`
- Flag is a read-only flag:
  - `permission_error(modify, flag, Flag)`

**Examples**

```prolog
| ?- set_logtalk_flag(unknown_entities, silent).
```

**See also**

`create_logtalk_flag/3`, `current_logtalk_flag/2`
create_logtalk_flag/3

Description

```
create_logtalk_flag(Flag, Value, Options)
```

Creates a new Logtalk flag and sets its default value. User-defined flags can be queried and set in the same way as pre-defined flags by using, respectively, the `current_logtalk_flag/2` and `set_logtalk_flag/2` built-in predicates.

This predicate is based on the specification of the SWI-Prolog `create_prolog_flag/3` built-in predicate and supports the same options: `access(Access)`, where `Access` can be either `read_write` (the default) or `read_only`; `keep(Keep)`, where `Keep` can be either `false` (the default) or `true`, for deciding if an existing definition of the flag should be kept or replaced by the new one; and `type(Type)` for specifying the type of the flag, which can be `boolean`, `atom`, `integer`, `float`, or `term` (which only restricts the flag value to ground terms). When the `type/1` option is not specified, the type of the flag is inferred from its initial value.

Template and modes

```
create_logtalk_flag(+atom, +ground, +list(ground))
```

Errors

- Flag is a variable:
  `instantiation_error`
- Value is not a ground term:
  `instantiation_error`
- Options is not a ground term:
  `instantiation_error`
- Flag is neither a variable nor an atom:
  `type_error(atom, Flag)`
- Options is neither a variable nor a list:
  `type_error(atom, Flag)`
- Value is not a valid value for flag Flag:
  `domain_error(flag_value, Flag + Value)`
- Flag is a system-defined flag:
  `permission_error(modify, flag, Flag)`
- An element Option of the list Options is not a valid option
  `domain_error(flag_option,Option)`
- The list Options contains a type(Type) option and Value is not a Type term
  `type_error(Type, Value)`

Examples

```
| ?- create_logtalk_flag(pretty_print_blobs, false, []).
```

See also

`current_logtalk_flag/2`, `set_logtalk_flag/2`
Built-in methods
**parameter/2**

**Description**

```
parameter(Number, Term)
```

Used in parametric objects (and parametric categories), this private method provides runtime access to the parameter values of the entity that contains the predicate clause whose body is being executed by using the argument number in the entity identifier. This predicate is implemented as a unification between its second argument and the corresponding implicit execution-context argument in the predicate containing the call. This unification occurs at the clause head when the second argument is not instantiated (the most common case). When the second argument is instantiated, the unification must be delayed to runtime and thus occurs at the clause body. See also *this/1*.

**Template and modes**

```
parameter(+integer, ?term)
```

**Errors**

- Number is a variable:
  
  *instantiate_error*

- Number is neither a variable nor an integer value:
  
  *type_error(integer, Number)*

- Number is smaller than one or greater than the parametric entity identifier arity:
  
  *domain_error(out_of_range, Number)*

- Entity identifier is not a compound term:
  
  *type_error(compound, Entity)*

**Examples**

```
:- object(box(_Color, _Weight)).

...

color(Color) :-
  parameter(1, Color).  % this clause is translated into a fact

heavy :-
  parameter(2, Weight),
  Weight > 10.         % after compilation, the >/2 call will be
                       % the first condition on the clause body

...
```

**See also**

self/1, sender/1, this/1
**self/1**

**Description**

```
self(Self)
```

Returns the object that has received the message under processing. This private method is translated to a unification between its argument and the corresponding implicit context argument in the predicate containing the call. This unification occurs at the clause head when the argument is not instantiated (the most common case).

**Template and modes**

```
self(?object_identifier)
```

**Errors**

*(none)*

**Examples**

```
test :-
    self(Self),  % after compilation, the write/1
    write('executing a method in behalf of '),  % call will be the first goal on
    writeq(Self), nl.  % the clause body
```

**See also**

`parameter/2, sender/1, this/1`
**sender/1**

**Description**

```
sender(Sender)
```

Returns the object that has sent the message under processing. This private method is translated into a unification between its argument and the corresponding implicit context argument in the predicate containing the call. This unification occurs at the clause head when the argument is not instantiated (the most common case).

**Template and modes**

```
sender(?object_identifier)
```

**Errors**

(none)

**Examples**

```
% after compilation, the write/1 call will be the first goal on the clause body:

test :-
   sender(Sender),
   write('executing a method to answer a message sent by '),
   writeq(Sender), nl.
```

**See also**

parameter/2, self/1, this/1
**this/1**

**Description**

```
this(This)
```

Unifies its argument with the identifier of the object for which the predicate clause whose body is being executed is defined (or the object importing the category that contains the predicate clause). This private method is implemented as a unification between its argument and the corresponding implicit execution-context argument in the predicate containing the call. This unification occurs at the clause head when the argument is not instantiated (the most common case). This method is useful for avoiding hard-coding references to an object identifier or for retrieving all object parameters with a single call when using parametric objects. See also `parameter/2`.

**Template and modes**

```
this(\?object_identifier)
```

**Errors**

(none)

**Examples**

```
% after compilation, the write/1 call will be the first goal on the clause body:

test :-
   this(This),
   write('executing a definition contained in '),
   writeq(This), nl.
```

**See also**

`parameter/2, self/1, sender/1`
**current_op/3**

**Description**

```
current_op(Priority, Specifier, Operator)
```

Enumerates, by backtracking, the visible operators declared for an object. Operators not declared using a scope directive are not found.

**Template and modes**

```
current_op(?operator_priority, ?operator_specifier, ?atom)
```

**Errors**

- Priority is neither a variable nor an integer:
  ```
  type_error(integer, Priority)
  ```
- Priority is an integer but not a valid operator priority:
  ```
  domain_error(operator_priority, Priority)
  ```
- Specifier is neither a variable nor an atom:
  ```
  type_error(atom, Specifier)
  ```
- Specifier is an atom but not a valid operator specifier:
  ```
  domain_error(operator_specifier, Specifier)
  ```
- Operator is neither a variable nor an atom:
  ```
  type_error(atom, Operator)
  ```

**Examples**

To enumerate, by backtracking, the local operators or the operators visible in *this*:

```
current_op(Priority, Specifier, Operator)
```

To enumerate, by backtracking, the public and protected operators visible in *self*:

```
::current_op(Priority, Specifier, Operator)
```

To enumerate, by backtracking, the public operators visible for an explicit object:

```
Object::current_op(Priority, Specifier, Operator)
```

**See also**

`current_predicate/1, predicate_property/2, op/3`
current_predicate/1

Description

\texttt{current_predicate(Predicate)}

Enumerates, by backtracking, the visible user predicates for an object.

Template and modes

\texttt{current_predicate(?predicate_indicator)}

Errors

Predicate is neither a variable nor a valid predicate indicator:

\texttt{type\_error(predicate\_indicator, Predicate)}

Predicate is a Functor/Arity term but Functor is neither a variable nor an atom:

\texttt{type\_error(atom, Name)}

Predicate is a Functor/Arity term but Arity is neither a variable nor an integer:

\texttt{type\_error(integer, Arity)}

Predicate is a Functor/Arity term but Arity is a negative integer:

\texttt{domain\_error(not\_less\_than\_zero, Arity)}

Examples

To enumerate, by backtracking, the locally visible user predicates or the user predicates visible in \texttt{this}:

\texttt{current\_predicate(Predicate)}

To enumerate, by backtracking, the public and protected user predicates visible in \texttt{self}:

\texttt{::current\_predicate(Predicate)}

To enumerate, by backtracking, the public user predicates visible for an explicit object:

\texttt{Object::current\_predicate(Predicate)}

See also

\texttt{current\_op/3, predicate\_property/2}
**predicate_property/2**

**Description**

| predicate_property(Predicate, Property) |

Enumerates, by backtracking, the properties of a visible predicate. The valid predicate properties are listed in the language grammar.

**Template and modes**

| predicate_property(+callable, ?predicate_property) |

**Errors**

- Predicate is a variable:
  - instantiation_error
- Predicate is neither a variable nor a callable term:
  - type_error(callable, Predicate)
- Property is neither a variable nor a valid predicate property:
  - domain_error(predicate_property, Property)

**Examples**

To enumerate, by backtracking, the properties of a locally visible user predicate or a user predicate visible in this:

| predicate_property(foo(_), Property) |

To enumerate, by backtracking, the properties of a public or protected predicate visible in self:

| ::predicate_property(foo(_), Property) |

To enumerate, by backtracking, the properties of a public predicate visible in an explicit object:

| Object::predicate_property(foo(_), Property) |

**See also**

current_op/3, current_predicate/1
abolish/1

Description

abolish(Predicate)
abolish(Functor/Arity)

Removes a runtime declared dynamic predicate or a local dynamic predicate from an object database.

Template and modes

abolish(+predicate_indicator)

Errors

Predicate is a variable:
  instantiation_error
Functor is a variable:
  instantiation_error
Arity is a variable:
  instantiation_error
Predicate is neither a variable nor a valid predicate indicator:
  type_error(predicate_indicator, Predicate)
Functor is neither a variable nor an atom:
  type_error(atom, Functor)
Arity is neither a variable nor an integer:
  type_error(integer, Arity)
Predicate is statically declared:
  permission_error(modify, predicate_declaration, Functor/Arity)
Predicate is a private predicate:
  permission_error(modify, private_predicate, Functor/Arity)
Predicate is a protected predicate:
  permission_error(modify, protected_predicate, Functor/Arity)
Predicate is a static predicate:
  permission_error(modify, static_predicate, Functor/Arity)
Predicate is not declared for the object receiving the message:
  existence_error(predicate_declaration, Functor/Arity)

Examples

To abolish a local dynamic predicate or a dynamic predicate in this:
  abolish(Predicate)
To abolish a public or protected dynamic predicate in self:
  ::abolish(Predicate)
To abolish a public dynamic predicate in an explicit object:
  Object::abolish(Predicate)
See also

asserta/1, assertz/1, clause/2, retract/1, retractall/1
dynamic/0, dynamic/1
asserta/1

Description

asserta(Head)
asserta((Head:-Body))

Asserts a clause as the first one for an object’s dynamic predicate. If the predicate is not already declared, then a dynamic predicate declaration is added to the object (assuming that we are asserting locally or that the compiler flag `dynamic_declarations` was switched on when the object was created or compiled).

This method may be used to assert clauses for predicates that are not declared dynamic for dynamic objects provided that the predicates are declared in `this`. This allows easy initialization of dynamically created objects when writing constructors.

Template and modes

asserta(+clause)

Errors

Head is a variable:
  instantiation_error
Head is a neither a variable nor a callable term:
  type_error(callable, Head)
Body cannot be converted to a goal:
  type_error(callable, Body)
The predicate indicator of Head, Functor/Arity, is that of a private predicate:
  permission_error(modify, private_predicate, Functor/Arity)
The predicate indicator of Head, Functor/Arity, is that of a protected predicate:
  permission_error(modify, protected_predicate, Functor/Arity)
The predicate indicator of Head, Functor/Arity, is that of a static predicate:
  permission_error(modify, static_predicate, Functor/Arity)
Target object was created/compiled with support for dynamic declaration of predicates turned off:
  permission_error(create, predicate_declaration, Functor/Arity)

Examples

To assert a clause as the first one for a local dynamic predicate or a dynamic predicate in `this`:
  asserta(Clause)
To assert a clause as the first one for any public or protected dynamic predicate in `self`:
  ::asserta(Clause)
To assert a clause as the first one for any public dynamic predicate in an explicit object:
  Object::asserta(Clause)

See also

abolish/1, assertz/1, clause/2, retract/1, retractall/1
dynamic/0, dynamic/1
assertz/1

Description

\[
\text{assertz(Head)} \\
\text{assertz(Head:-Body)}
\]

Asserts a clause as the last one for an object's dynamic predicate. If the predicate is not already declared, then a dynamic predicate declaration is added to the object (assuming that we are asserting locally or that the compiler flag `dynamic_declarations` was switched on when the object was created or compiled).

This method may be used to assert clauses for predicates that are not declared dynamic for dynamic objects provided that the predicates are declared in `this`. This allows easy initialization of dynamically created objects when writing constructors.

Template and modes

```
assertz(+clause)
```

Errors

- Head is a variable:
  \text{instantiation_error}
- Head is a neither a variable nor a callable term:
  \text{type_error} (callable, Head)
- Body cannot be converted to a goal:
  \text{type_error} (callable, Body)
- The predicate indicator of Head, Functor/Arity, is that of a private predicate:
  \text{permission_error} (modify, private_predicate, Functor/Arity)
- The predicate indicator of Head, Functor/Arity, is that of a protected predicate:
  \text{permission_error} (modify, protected_predicate, Functor/Arity)
- The predicate indicator of Head, Functor/Arity, is that of a static predicate:
  \text{permission_error} (create, staticpredicate, Functor/Arity)
- Target object was created/compiled with support for dynamic declaration of predicates turned off:
  \text{permission_error} (create, predicate_declaration, Functor/Arity)

Examples

- To assert a clause as the last one for a local dynamic predicate or a dynamic predicate in `this`:
  \text{assertz(Clause)}
- To assert a clause as the last one for any public or protected dynamic predicate in `self`:
  ::assertz(Clause)
- To assert a clause as the last one for any public dynamic predicate in an explicit object:
  Object::assertz(Clause)

See also

abolish/1, asserta/1, clause/2, retract/1, retractall/1
dynamic/0, dynamic/1
**clause/2**

**Description**

```
clause(Head, Body)
```

Enumerates, by backtracking, the clauses of an object’s dynamic predicates.

This method may be used to enumerate clauses for predicates that are not declared dynamic for dynamic objects provided that the predicates are declared in `this`.

**Template and modes**

```
clause(+callable, ?body)
```

**Errors**

- Head is a variable:  
  `instantiation_error`
- Head is a neither a variable nor a callable term:  
  `type_error(callable, Head)`
- Body is a neither a variable nor a callable term:  
  `type_error(callable, Body)`
- The predicate indicator of Head, Functor/Arity, is that of a private predicate:  
  `permission_error(access, private_predicate, Functor/Arity)`
- The predicate indicator of Head, Functor/Arity, is that of a protected predicate:  
  `permission_error(access, protected_predicate, Functor/Arity)`
- The predicate indicator of Head, Functor/Arity, is that of a static predicate:  
  `permission_error(access, static_predicate, Functor/Arity)`
- Head is not a declared predicate:  
  `existence_error(predicate_declaration, Functor/Arity)`

**Examples**

To retrieve a matching clause of a local dynamic predicate or a dynamic predicate in `this`:
```
clause(Head, Body)
```

To retrieve a matching clause of a public or protected dynamic predicate in `self`:
```
::clause(Head, Body)
```

To retrieve a matching clause of a public dynamic predicate in an explicit object:
```
Object::clause(Head, Body)
```

**See also**

- `abolish/1`  
- `asserta/1`  
- `assertz/1`  
- `retract/1`  
- `retractall/1`  
- `dynamic/0`  
- `dynamic/1`
**retract/1**

**Description**

```prolog
retract(Head)
retract((Head:-Body))
```

Retracts a dynamic clause from an object.

This method may be used to retract clauses for predicates that are not declared dynamic for dynamic objects provided that the predicates are declared in *this*.

**Template and modes**

```prolog
retract(+clause)
```

**Errors**

- Head is a variable:
  - `instantiation_error`
- Head is neither a variable nor a callable term:
  - `type_error(callable, Head)`
- The predicate indicator of Head, Functor/Arity, is that of a private predicate:
  - `permission_error(modify, private_predicate, Functor/Arity)`
- The predicate indicator of Head, Functor/Arity, is that of a protected predicate:
  - `permission_error(modify, protected_predicate, Functor/Arity)`
- The predicate indicator of Head, Functor/Arity, is that of a static predicate:
  - `permission_error(modify, static_predicate, Functor/Arity)`
- The predicate indicator of Head, Functor/Arity, is not declared:
  - `existence_error(predicate_declaration, Functor/Arity)`

**Examples**

To retract a matching clause of a local dynamic predicate or a dynamic predicate in *this*:

```prolog
retract(Clause)
```

To retract a matching clause of a public or protected dynamic predicate in *self*:

```prolog
::retract(Clause)
```

To retract a matching clause of a public dynamic predicate in an explicit object:

```prolog
Object::retract(Clause)
```

**See also**

`abolish/1, asserta/1, assertz/1, clause/2, retractall/1`

`dynamic/0, dynamic/1`
**retractall/1**

**Description**

retractall(Head)

Retracts all predicate clauses with a matching head from an object.

This method may be used to retract clauses for predicates that are not declared dynamic for dynamic objects provided that the predicates are declared in *this*.

**Template and modes**

retractall(+callable)

**Errors**

- Head is a variable:
  
  instantiation_error

- Head is neither a variable nor a callable term:
  
  type_error(callable, Head)

- The predicate indicator of Head, Functor/Arity, is that of a private predicate:
  
  permission_error(modify, private_predicate, Functor/Arity)

- The predicate indicator of Head, Functor/Arity, is that of a protected predicate:
  
  permission_error(modify, protected_predicate, Functor/Arity)

- The predicate indicator of Head, Functor/Arity, is that of a static predicate:
  
  permission_error(modify, static_predicate, Functor/Arity)

- The predicate indicator of Head, Functor/Arity, is not declared:
  
  existence_error(predicate_declaration, Functor/Arity)

**Examples**

To retract all local predicate clauses or all predicate clauses in *this* with a matching head:

retractall(Head)

To retract all public or protected predicate clauses with a matching head in *self*:

::retractall(Head)

To retract all public predicate clauses with a matching head in an explicit object:

Object::retractall(Head)

**See also**

abolish/1, asserta/1, assertz/1, clause/2, retract/1
dynamic/0, dynamic/1
**call/1-N**

**Description**

```
call(Goal)
call(Closure, Arg1, ...)
call(Object::Closure, Arg1, ...)
call(::Closure, Arg1, ...)
```

Calls a goal, which might be constructed by appending additional arguments to a closure. The upper limit for \( N \) depends on the upper limit for the arity of a compound term of the back-end Prolog compiler. This built-in meta-predicate is declared as a private method and thus cannot be used as a message to an object. When using a back-end Prolog compiler supporting a module system, calls in the format `call(Module::Closure, Arg1, ...)` may also be used.

Note that `::Closure` closures are only supported for local meta-calls. Passing this kind of closure as an argument of a meta-predicate called using message sending is not supported and always fails as the value of `self` is lost in the round-trip to the object defining the meta-predicate. The workaround is to simply call the `self(Self)` built-in method and use the returned value with a `Self::Closure` closure instead.

**Template and modes**

```
call(+callable)
call(+callable, ?term)
call(+callable, ?term, ?term)
...
```

**Errors**

- Goal is a variable:
  - `instantiation_error`

- Goal is neither a variable nor a callable term:
  - `type_error(callable, Goal)`

- Closure is a variable:
  - `instantiation_error`

- Closure is neither a variable nor a callable term:
  - `type_error(callable, Closure)`

**Examples**

- Call a goal, constructed by appending additional arguments to a closure, in the context of the object or category containing the call:
  - `call(Closure, Arg1, Arg2, ...)`

- To send a goal, constructed by appending additional arguments to a closure, as a message to `self`:
  - `call(::Closure, Arg1, Arg2, ...)`

- To send a goal, constructed by appending additional arguments to a closure, as a message to an explicit object:
  - `call(Object::Closure, Arg1, Arg2, ...)`

**See also**

`ignore/1`, `once/1`, `\+/1`

130
ignore/1

Description

\begin{verbatim}
ignore(Goal)
\end{verbatim}

This predicate succeeds whether its argument succeeds or fails and it is not re-executable. This built-in meta-predicate is declared as a private method and thus cannot be used as a message to an object.

Template and modes

\begin{verbatim}
ignore(+callable)
\end{verbatim}

Errors

- Goal is a variable: \texttt{instantiation_error}
- Goal is neither a variable nor a callable term: \texttt{type_error(callable, Goal)}

Examples

Call a goal and succeeding even if it fails:
\begin{verbatim}
ignore(Goal)
\end{verbatim}

To send a goal as a non-backtraceable message to \textit{self}:
\begin{verbatim}
ignore(:,:,Goal)
\end{verbatim}

To send a goal as a non-backtraceable message to an explicit object:
\begin{verbatim}
ignore(Object::Goal)
\end{verbatim}

See also
call/1-N, once/1, \+/1
once/1

Description
once(Goal)

This predicate behaves as \texttt{call(Goal)} but it is not re-executable. This built-in meta-predicate is declared as a private method and thus cannot be used as a message to an object.

Template and modes
once(+callable)

Errors

Goal is a variable: 
\texttt{instantiation_error}

Goal is neither a variable nor a callable term: 
\texttt{type_error(callable, Goal)}

Examples

Call a goal deterministically in the context of the object or category containing the call:

\texttt{once(Goal)}

To send a goal as a non-backtraceable message to \texttt{self}:

\texttt{once(\::Goal)}

To send a goal as a non-backtraceable message to an explicit object:

\texttt{once(Object::Goal)}

See also

\texttt{call/1-N, ignore/1, \+/1}
\+/1

Description

\+ Goal

Not-provable meta-predicate. True iff \texttt{call(Goal)} is false. This built-in meta-predicate cannot be used as a message to an object.

Template and modes

\+ +callable

Errors

Goal is a variable:
\begin{itemize}
  \item \texttt{instantiation_error}
\end{itemize}
Goal is neither a variable nor a callable term:
\begin{itemize}
  \item \texttt{type_error(callable, Goal)}
\end{itemize}

Examples

- Not-provable goal in the context of the object or category containing the call:
  \begin{verbatim}
  \+ Goal
  \end{verbatim}
- Not-provable goal sent as a message to \texttt{self}:
  \begin{verbatim}
  \+ ::Goal
  \end{verbatim}
- Not-provable goal sent as a message to an explicit object:
  \begin{verbatim}
  \+ Object::Goal
  \end{verbatim}

See also

call/1-N, ignore/1, once/1
catch/3

Description

catch(Goal, Catcher, Recovery)

Catches exceptions thrown by a goal. See the Prolog ISO standard definition. This built-in meta-predicate is declared as a private method and thus cannot be used as a message to an object.

Template and modes

catch(?callable, ?term, ?term)

Errors

Goal is a variable:

instantiation_error

Goal is neither a variable nor a callable term:

type_error(callable, Goal)

Examples

(none)

See also

throw/1
**throw/1**

**Description**

```
throw(Exception)
```

Throws an exception. This built-in predicate is declared as a private method and thus cannot be used as a message to an object.

**Template and modes**

```
throw(+nonvar)
```

**Errors**

- Exception is a variable: `instantiation_error`
- Exception does not unify with the second argument of any call of `catch/3`: `system_error`

**Examples**

(none)

**See also**

`catch/3`
**bagof/3**

**Description**

```prolog
call(Term, Goal, List)
```

See the Prolog ISO standard definition. This built-in meta-predicate is declared as a private method and thus cannot be used as a message to an object.

**Template and modes**

```prolog
call(@term, +callable, -list)
```

**Errors**

(see the Prolog ISO standard)

**Examples**

To find all solutions in the context of the object or category containing the call:

```
call(Term, Goal, List)
```

To find all solutions by sending the goal as a message to `self`:

```
call(Term, ::Goal, List)
```

To find all solutions by sending the goal as a message to an explicit object:

```
call(Term, Object::Goal, List)
```

**See also**

`findall/3`, `findall/4`, `forall/2`, `setof/3`
**findall/3**

**Description**

findall(Term, Goal, List)

See the Prolog ISO standard definition. This built-in meta-predicate is declared as a private method and thus cannot be used as a message to an object.

**Template and modes**

findall(?term, +callable, ?list)

**Errors**

(see the Prolog ISO standard)

**Examples**

To find all solutions in the context of the object or category containing the call:

findall(Term, Goal, List)

To find all solutions by sending the goal as a message to `self`:

findall(Term, ::Goal, List)

To find all solutions by sending the goal as a message to an explicit object:

findall(Term, Object::Goal, List)

**See also**

bagof/3, findall/4, forall/2, setof/3
findall/4

Description

findall(Term, Goal, List, Tail)

Variant of the standard findall/3 that allows passing the tail of the results list. This built-in meta-predicate is declared as a private method and thus cannot be used as a message to an object.

Template and modes

findall(?term, +callable, ?list, +list)

Errors

(same as the standard findall/3 predicate)

Examples

To find all solutions in the context of the object or category containing the call:
findall(Term, Goal, List, Tail)

To find all solutions by sending the goal as a message to self:
findall(Term, ::Goal, List, Tail)

To find all solutions by sending the goal as a message to an explicit object:
findall(Term, Object::Goal, List, Tail)

See also

bagof/3, findall/3, forall/2, setof/3
forall/2

Description

forall(Generator, Test)

For all solutions of Generator, Test is true. This built-in meta-predicate is declared as a private method and thus cannot be used as a message to an object.

Template and modes

forall(+callable, +callable)

Errors

Either Generator or Test is a variable:
  instantiation_error
Generator is neither a variable nor a callable term:
  type_error(callable, Generator)
Test is neither a variable nor a callable term:
  type_error(callable, Test)

Examples

To call both goals in the context of the object or category containing the call:
  forall(Generator, Test)
To send both goals as messages to self:
  forall(:Generator, :Test)
To send both goals as messages to explicit objects:
  forall(Object1::Generator, Object2::Test)

See also

bagof/3, findall/3, findall/4, setof/3
**setof/3**

**Description**

```prolog
call(setof(Term, Goal, List))
```

See the Prolog ISO standard definition. This built-in meta-predicate is declared as a private method and thus cannot be used as a message to an object.

**Template and modes**

```prolog
call(setof(@term, +callable, -list))
```

**Errors**

(see the Prolog ISO standard)

**Examples**

To find all solutions in the context of the object or category containing the call:

```prolog
call(setof(Term, Goal, List))
```

To find all solutions by sending the goal as a message to `self`:

```prolog
call(setof(Term, ::Goal, List))
```

To find all solutions by sending the goal as a message to an explicit object:

```prolog
call(setof(Term, Object::Goal, List))
```

**See also**

`bagof/3`, `findall/3`, `findall/4`, `forall/2`
before/3

Description

User-defined method for handling before events. This method is declared in the monitoring built-in protocol as a public predicate. Note that you can make its scope protected or private by using, respectively, protected or private implementation of the monitoring protocol.

Template and modes

```
before(Object, Message, Sender)
```

Errors

(none)

Examples

```
:- object(...,
    implements(monitoring),
    ...).

before(Object, Message, Sender) :-
    writeq(Object), write(':'), writeq(Message),
    write(' from '), writeq(Sender), nl.
```

See also

after/3
abolish_events/5, current_event/5, define_events/5
**after/3**

**Description**

| after(Object, Message, Sender) |

User-defined method for handling after events. This method is declared in the monitoring built-in protocol as a public predicate. Note that you can make its scope protected or private by using, respectively, protected or private implementation of the monitoring protocol.

**Template and modes**

| after(?object_identifier, ?callable, ?object_identifier) |

**Errors**

(none)

**Examples**

```prolog
:- object(...,
   implements(monitoring),
   ...).

after(Object, Message, Sender) :-
   writeq(Object), write('::'), writeq(Message),
   write(' from '), writeq(Sender), nl.
```

**See also**

before/3
abolish_events/5, current_event/5, define_events/5
**forward/1**

**Description**

```
forward(Message)
```

User-defined method for forwarding unknown messages sent to an object (using the `::/2` control construct), automatically called by the runtime when defined. This method is declared in the `forwarding` built-in protocol as a public predicate. Note that you can make its scope protected or private by using, respectively, protected or private implementation of the `forwarding` protocol.

**Template and modes**

```
forward(+callable)
```

**Errors**

```
(none)
```

**Examples**

```
:- object(proxy,
   implements(forwarding),
   ...
).

forward(Message) :-
   % delegate the unknown message to other object
   [real::Message].
```

**See also**

`[]/1`
call//1-N

Description

This non-terminal takes a closure and is processed by appending the input list of tokens and the list of remaining tokens to the arguments of the closure. This built-in non-terminal is interpreted as a private non-terminal and thus cannot be used as a message to an object. When using a back-end Prolog compiler supporting a module system, calls in the format `call(Module::Closure)` may also be used. By using as argument a lambda expression, this built-in non-terminal provides controlled access to the input list of tokens and to the list of the remaining tokens processed by the grammar rule containing the call.

Template and modes

```
call(+callable)
call(+callable, ?term)
call(+callable, ?term, ?term)
...
```

Errors

- Closure is a variable:
  - instantiation_error
- Closure is neither a variable nor a callable term:
  - type_error(callable, Closure)

Examples

- Calls a goal, constructed by appending the input list of tokens and the list of remaining tokens to the arguments of the closure, in the context of the object or category containing the call:
  ```
call(Closure)
  ```
- To send a goal, constructed by appending the input list of tokens and the list of remaining tokens to the arguments of the closure, as a message to `self`:
  ```
call(::Closure)
  ```
- To send a goal, constructed by appending the input list of tokens and the list of remaining tokens to the arguments of the closure, as a message to an explicit object:
  ```
call(Object::Closure)
  ```

See also

phrase//1, phrase/2, phrase/3
**phrase//1**

**Description**

\texttt{phrase(NonTerminal)}

This non-terminal takes a non-terminal or a grammar rule body and parses it using the current implicit list of tokens. A common use is to wrap what otherwise would be a naked variable in a grammar rule body.

**Template and modes**

\texttt{phrase(+callable)}

**Errors**

- NonTerminal is a variable:
  
  \texttt{instantiation_error}

- NonTerminal is neither a variable nor a callable term:
  
  \texttt{type_error(callable, NonTerminal)}

**Examples**

**See also**

\texttt{call//1-N, phrase/2, phrase/3}
**phrase/2**

**Description**

True when the `GrammarRuleBody` grammar rule body can be applied to the `Input` list of tokens. In the most common case, `GrammarRuleBody` is a non-terminal defined by a grammar rule. This built-in method is declared private and thus cannot be used as a message to an object. When using a back-end Prolog compiler supporting a module system, calls in the format `phrase(Module::GrammarRuleBody, Input)` may also be used.

This method is opaque to cuts in the first argument. When the first argument is sufficiently instantiated at compile time, the method call is compiled in order to eliminate the implicit overheads of converting the grammar rule body into a goal and meta-calling it. For performance reasons, the second argument is only type-checked at compile time.

**Template and modes**

```
phrase(+callable, ?list)
```

**Errors**

- NonTerminal is a variable:
  
  `instantiateion_error`

- NonTerminal is neither a variable nor a callable term:
  
  `type_error(callable, NonTerminal)`

**Examples**

To parse a list of tokens using a local non-terminal:

```
phrase(NonTerminal, Input)
```

To parse a list of tokens using a non-terminal within the scope of `self`:

```
phrase(NonTerminal, Input)
```

To parse a list of tokens using a public non-terminal of an explicit object:

```
phrase(Object::NonTerminal, Input)
```

**See also**

`call//1-N`, `phrase//1`, `phrase/3`
phrase/3

Description

phrase(GrammarRuleBody, Input, Rest)
phrase(::GrammarRuleBody, Input, Rest)
phrase(Object::GrammarRuleBody, Input, Rest)

True when the GrammarRuleBody grammar rule body can be applied to the Input-Rest difference list of tokens. In the most common case, GrammarRuleBody is a non-terminal defined by a grammar rule. This built-in method is declared private and thus cannot be used as a message to an object. When using a back-end Prolog compiler supporting a module system, calls in the format phrase(Module:GrammarRuleBody, Input, Rest) may also be used.

This method is opaque to cuts in the first argument. When the first argument is sufficiently instantiated at compile time, the method call is compiled in order to eliminate the implicit overheads of converting the grammar rule body into a goal and meta-calling it. For performance reasons, the second and third arguments are only type-checked at compile time.

Template and modes

phrase(+callable, ?list, ?list)

Errors

NonTerminal is a variable:
  instantiation_error
NonTerminal is neither a variable nor a callable term:
  type_error(callable, NonTerminal)

Examples

To parse a list of tokens using a local non-terminal:
  phrase(NonTerminal, Input, Rest)
To parse a list of tokens using a non-terminal within the scope of self:
  phrase(:NonTerminal, Input, Rest)
To parse a list of tokens using a public non-terminal of an explicit object:
  phrase(Object::NonTerminal, Input, Rest)

See also

call//1-N, phrase//1, phrase/2
**expand_term/2**

**Description**

```
expand_term(Term, Expansion)
```

Expands a term. The most common use is to expand a grammar rule into a clause. Users may override the default Logtalk grammar rule translator by defining clauses for the `term_expansion/2` hook predicate.

The expansion works as follows: if the first argument is a variable, then it is unified with the second argument; if the first argument is not a variable and there are local or inherited clauses for the `term_expansion/2` hook predicate within scope, then this predicate is called to provide an expansion that is then unified with the second argument; if the `term_expansion/2` predicate is not used and the first argument is a compound term with functor `-->/2` then the default Logtalk grammar rule translator is used, with the resulting clause being unified with the second argument; when the translator is not used, the two arguments are unified. The `expand_term/2` predicate may return a single term or a list of terms.

This built-in method may be used to expand a grammar rule into a clause for use with the built-in database methods.

Automatic term expansion is only performed at compile time (to expand terms read from a source file) when using hook objects. This predicate can be used by the user to manually perform term expansion at runtime (for example, to convert a grammar rule into a clause).

**Template and modes**

```
expand_term(?term, ?term)
```

**Errors**

(none)

**Examples**

(none)

**See also**

`expand_goal/2`, `goal_expansion/2`, `term_expansion/2`
**term_expansion/2**

**Description**

\[
\text{term_expansion}(\text{Term}, \text{Expansion})
\]

Defines an expansion for a term. This predicate, when defined and within scope, is automatically called by the `expand_term/2` method. When that is not the case, the `expand_term/2` method only uses the default expansions. Use of this predicate by the `expand_term/2` method may be restricted by changing its default public scope.

The `term_expansion/2` predicate may return a list of terms.

Term expansion may be also be applied when compiling source files by defining the object providing access to the `term_expansion/2` clauses as a *hook object*. Clauses for the `term_expansion/2` predicate defined within an object or a category are never used in the compilation of the object or the category itself. Moreover, in this context, terms wrapped using the `(){}/1` compiler bypass control construct are not expanded and any expanded term wrapped in this control construct will not be further expanded.

Objects and categories implementing this predicate should declare that they implement the *expanding* protocol if no ancestor already declares it. This protocol implementation relation can be declared as either protected or private to restrict the scope of this predicate.

**Template and modes**

\[
\text{term_expansion}(+\text{nonvar}, -\text{nonvar})
\]

\[
\text{term_expansion}(+\text{nonvar}, -\text{list}(\text{nonvar}))
\]

**Errors**

*(none)*

**Examples**

\[
\text{term_expansion}((:- \text{license}(\text{default})), (:- \text{license}(\text{gplv3}))).
\]

\[
\text{term_expansion}(\text{data}(\text{Millimeters}), \text{data}(\text{Meters})) :- \text{Meters is Millimeters / 1000}.
\]

**See also**

`expand_goal/2`, `expand_term/2`, `goal_expansion/2`, `logtalk_load_context/2`
**expand_goal/2**

**Description**

```
expand_goal(Goal, ExpandedGoal)
```

Expands a goal.

The expansion works as follows: if the first argument is a variable, then it is unified with the second argument; if the first argument is not a variable and there are local or inherited clauses for the `goal_expansion/2` hook predicate within scope, then this predicate is recursively called until a fixed-point is reached to provide an expansion that is then unified with the second argument; if the `goal_expansion/2` predicate is not within scope, the two arguments are unified.

Automatic goal expansion is only performed at compile time (to expand the body of clauses and meta-directives read from a source file) when using hook objects. This predicate can be used by the user to manually perform goal expansion at runtime (for example, before asserting a clause).

**Template and modes**

```
expand_goal(?term, ?term)
```

**Errors**

*(none)*

**Examples**

*(none)*

**See also**

`expand_term/2, goal_expansion/2, term_expansion/2`
**goal_expansion/2**

**Description**

```
goal_expansion(Goal, ExpandedGoal)
```

Defines an expansion for a goal. The first argument is the goal to be expanded. The expanded goal is returned in the second argument. This predicate is called recursively on the expanded goal until a fixed point is reached. Thus, care must be taken to avoid compilation loops. This predicate, when defined and within scope, is automatically called by the `expand_goal/2` method. Use of this predicate by the `expand_goal/2` method may be restricted by changing its default public scope.

Goal expansion may be also be applied when compiling source files by defining the object providing access to the `goal_expansion/2` clauses as a hook object. Clauses for the `goal_expansion/2` predicate defined within an object or a category are never used in the compilation of the object or the category itself. Moreover, in this context, goals wrapped using the `{}/1` compiler bypass control construct are not expanded and any expanded goal wrapped in this control construct will not be further expanded.

Objects and categories implementing this predicate should declare that they implement the expanding protocol if no ancestor already declares it. This protocol implementation relation can be declared as either protected or private to restrict the scope of this predicate.

**Template and modes**

```
goal_expansion(+callable, -callable)
```

**Errors**

*(none)*

**Examples**

```
goal_expansion(write(Term), (write_term(Term, []), nl)).
goal_expansion(read(Term), (write('Input: '), {read(Term)})).
```

**See also**

`expand_goal/2`, `expand_term/2`, `term_expansion/2`, `logtalk_load_context/2`
print_message/3

Description

Built-in method for printing a message represented by a term, which is converted to the message text using the logtalk::message_tokens(Term, Component) hook predicate. This method is declared in the logtalk built-in object as a public predicate. The line prefix and the output stream used for each Kind-Component pair can be found using the logtalk::message_prefix_stream(Kind, Component, Prefix, Stream) hook predicate.

This predicate starts by converting the message term to a list of tokens and by calling the logtalk::message_hook(Message, Kind, Component, Tokens) hook predicate. If this predicate succeeds, the print_message/3 predicate assumes that the message have been successfully printed.

Template and modes

print_message(+nonvar, +nonvar, +nonvar)

Errors

(none)

Examples

..., logtalk::print_message(information, core, redefining_entity(object, foo)), ...

See also

message_hook/4, message_prefix_stream/4, message_tokens//2, print_message_token/4, print_message_tokens/3, ask_question/5, question_hook/6, question_prompt_stream/4
**message_tokens//2**

**Description**

```
message_tokens(Message, Component)
```

User-defined non-terminal hook used to rewrite a message term into a list of tokens and declared in the logtalk built-in object as a public, multifile, and dynamic non-terminal. The list of tokens can be printed by calling the `print_message_tokens/3` method. This non-terminal hook is automatically called by the `print_message/3` method.

**Template and modes**

```
message_tokens(+nonvar, +nonvar)
```

**Errors**

*(none)*

**Examples**

```
:- multifile(logtalk::message_tokens//2).
:- dynamic(logtalk::message_tokens//2).

logtalk::message_tokens(redefining_entity(Type, Entity), core) -->
  ['Redefining ~w ~q'~[Type, Entity], nl].
```

**See also**

**message_hook/4**

**Description**

```
message_hook(Message, Kind, Component, Tokens)
```

User-defined hook method for intercepting printing of a message, declared in the logtalk built-in object as a public, multifile, and dynamic predicate. This hook method is automatically called by the `print_message/3` method. When the call succeeds, the `print_message/3` method assumes that the message have been successfully printed.

**Template and modes**

```
message_hook(@nonvar, @nonvar, @nonvar, @list(nonvar))
```

**Errors**

*(none)*

**Examples**

```prolog
:- multifile(logtalk::message_hook/4).
:- dynamic(logtalk::message_hook/4).

% print silent messages instead of discarding them as default
logtalk::message_hook(_, silent, core, Tokens) :-
    logtalk::message_prefix_stream(silent, core, Prefix, Stream),
    logtalk::print_message_tokens(Stream, Prefix, Tokens).
```

**See also**

message_prefix_stream/4, message_tokens//2, print_message/3, print_message_tokens/3, print_message_token/4
ask_question/5, question_hook/6, question_prompt_stream/4
message_prefix_stream/4

Description

message_prefix_stream(Kind, Component, Prefix, Stream)

User-defined hook method for specifying the default prefix and stream for printing a message for a given kind and component. This method is declared in the logtalk built-in object as a public, multifile, and dynamic predicate.

Template and modes

message_prefix_stream(?nonvar, ?nonvar, ?atom, ?stream_or_alias)

Errors

(none)

Examples

:- multifile(logtalk::message_prefix_stream/4).
:- dynamic(logtalk::message_prefix_stream/4).

logtalk::message_prefix_stream(information, core, '% ', user_output).

See also

message_hook/4, message_tokens//2, print_message/3, print_message_tokens/3, print_message_token/4, ask_question/5, question_hook/6, question_prompt_stream/4
**print_message_tokens/3**

**Description**

```
print_message_tokens(Stream, Prefix, Tokens)
```

Built-in method for printing a list of message tokens, declared in the `logtalk` built-in object as a public predicate. This method is automatically called by the `print_message/3` method (assuming that the message was not intercepted by a `message_hook/4` definition) and calls the user-defined hook predicate `print_message_token/4` for each token. When a call to this hook predicate succeeds, the `print_message_tokens/3` predicate assumes that the token have been printed. When the call fails, the `print_message_tokens/3` predicate uses a default printing procedure for the token.

**Template and modes**

```
print_message_tokens(@stream_or_alias, +atom, @list(nonvar))
```

**Errors**

( none )

**Examples**

```
..., logtalk::print_message_tokens(user_output, '% ', ['Redefining \w ~q'-[object, foo], nl]), ...
```

**See also**

`message_hook/4`, `message_prefix_stream/4`, `message_tokens//2`, `print_message/3`, `print_message_token/4`, `ask_question/5`, `question_hook/6`, `question_prompt_stream/4`
**print_message_token/4**

**Description**

```
print_message_token(Stream, Prefix, Token, Tokens)
```

User-defined hook method for printing a message token, declared in the logtalk built-in object as a public, multifile, and dynamic predicate. It allows the user to intercept the printing of a message token. This hook method is automatically called by the `print_message_tokens/3` built-in method for each token.

**Template and modes**

```
print_message_token(@stream_or_alias, @atom, @nonvar, @list(nonvar))
```

**Errors**

(none)

**Examples**

```
:- multifile(logtalk::print_message_token/4).
:- dynamic(logtalk::print_message_token/4).

% ignore all flush tokens
logtalk::print_message_token(_, _, flush, []).
```

**See also**

message_hook/4, message_prefix_stream/4, message_tokens//2, print_message/3, print_message_tokens/3, ask_question/5, question_hook/6, question_prompt_stream/4
ask_question/5

Description

ask_question(Question, Kind, Component, Check, Answer)

Built-in method for asking a question represented by a term, Question, which is converted to the question text using the \texttt{logtalk::message_tokens(Question, Component)} hook predicate. This method is declared in the \texttt{logtalk} built-in object as a public predicate. The default question prompt and the input stream used for each \texttt{Kind-Component} pair can be found using the \texttt{logtalk::question_prompt_stream(Kind, Component, Prompt, Stream)} hook predicate. The Check argument is a closure that is converted into a checking goal by extending it with the user supplied answer. This predicate implements a read-loop that terminates when the checking predicate succeeds.

This predicate starts by calling the \texttt{logtalk::question_hook(Question, Kind, Component, Check, Answer)} hook predicate. If this predicate succeeds, the \texttt{ask_question/5} predicate assumes that the question have been successfully asked and replied.

Template and modes

\begin{verbatim}
ask_question(+nonvar, +nonvar, +nonvar, +callable, -term)
\end{verbatim}

Meta-predicate template

\begin{verbatim}
ask_question(*, *, *, 1, *)
\end{verbatim}

Errors

\begin{verbatim}
(none)
\end{verbatim}

Examples

\begin{verbatim}
..., logtalk::ask_question(enter_context_spy_point(Template), question, debugger, callable, SpyPoint), ...
\end{verbatim}

print_message_tokens/3, print_message_token/4
\end{verbatim}
**question_hook/6**

**Description**

`question_hook(Question, Kind, Component, Tokens, Check, Answer)`

User-defined hook method for intercepting asking a question, declared in the `logtalk` built-in object as a public, multifile, and dynamic predicate. This hook method is automatically called by the `ask_question/5` method. When the call succeeds, the `ask_question/5` method assumes that the question have been successfully asked and replied.

**Template and modes**

`question_hook(+nonvar, +nonvar, +nonvar, +list(nonvar), +callable, -term)`

**Meta-predicate template**

`question_hook(*, *, *, *, 1, *)`

**Errors**

(none)

**Examples**

```prolog
:- multifile(logtalk::question_hook/6).
:- dynamic(logtalk::question_hook/6).
% use a pre-defined answer instead of asking the user
logtalk::question_hook(upper_limit, question, my_app, _, float, 3.7).
```

**question_prompt_stream/4**

**Description**

```
question_prompt_stream(Kind, Component, Prompt, Stream)
```

User-defined hook method for specifying the default prompt and input stream for asking a question for a given kind and component. This method is declared in the `logtalk` built-in object as a public, multifile, and dynamic predicate.

**Template and modes**

```
question_prompt_stream(?nonvar, ?nonvar, ?atom, ?stream_or_alias)
```

**Errors**

(none)

**Examples**

```
:- multifile(logtalk::question_prompt_stream/4).
:- dynamic(logtalk::question_prompt_stream/4).

logtalk::question_prompt_stream(question, debugger, '    > ', user_input).
```

coinductive_success_hook/1-2

Description

User-defined hook predicates that are automatically called in case of coinductive success when proving a query for a coinductive predicate. The hook predicates are called with the head of the coinductive predicate on coinductive success and, optionally, with the hypothesis used that to reach coinductive success.

When both hook predicates are defined, the coinductive_success_hook/1 clauses are only used if no coinductive_success_hook/2 clause applies. The compiler ensures zero performance penalties when defining coinductive predicates without a corresponding definition for the coinductive success hook predicates.

The compiler assumes that these hook predicates are defined as static predicates in order to optimize their use.

::/2

Description

| Object::Message |
| {Proxy}::Message |

Sends a message to an object. The message argument must match a public predicate of the receiver object. When the message corresponds to a protected or private predicate, the call is only valid if the sender matches the predicate scope container. When the predicate is declared but not defined, the message simply fails (as per the closed-world assumption).

The {Proxy}::Message syntax allows simplified access to parametric object proxies. Its operational semantics is equivalent to the goal conjunction (call(Proxy), Proxy::Message). I.e. Proxy is proved within the context of the pseudo-object user and, if successful, the goal term is used as a parametric object identifier. Exceptions thrown when proving Proxy are handled by the ::/2 control construct. This syntax construct supports backtracking over the {Proxy} goal.

The lookups for the message declaration and the corresponding method are performed using a depth-first strategy. Depending on the value of the optimize flag, these lookups are performed at compile time whenever sufficient information is available. When the lookups are performed at runtime, a caching mechanism is used to improve performance in subsequent messages.

Template and modes

+object_identifier::+callable
{+object_identifier}::+callable

Errors

Either Object or Message is a variable:

instantiation_error

Object is not a valid object identifier:

type_error(object_identifier, Object)

Message is neither a variable nor a callable term:

type_error(callable, Message)

Message, with predicate indicator Functor/Arity, is declared private:

permission_error(access, private_predicate, Functor/Arity)

Message, with predicate indicator Functor/Arity, is declared protected:

permission_error(access, protected_predicate, Functor/Arity)

Message, with predicate indicator Functor/Arity, is not declared:

existence_error(predicate_declaration, Functor/Arity)

Object does not exist:

existence_error(object, Object)

Proxy is a variable:

instantiation_error

Proxy is not a valid object identifier:

type_error(object_identifier, Proxy)
The predicate Proxy does not exist in the *user* pseudo-object:

```
existence_error(procedure, ProxyFunctor/ProxyArity)
```

**Examples**

```
| ?- list::member(X, [1, 2, 3]).
X = 1 ;
X = 2 ;
X = 3
yes
```

**See also**

::/1, ^^/1, []/1
::/1

Description

Send a message to self. Only used in the body of a predicate definition. The argument should match a public or protected predicate of self. It may also match a private predicate if the predicate is within the scope of the object where the method making the call is defined, if imported from a category, if used from within a category, or when using private inheritance. When the predicate is declared but not defined, the message simply fails (as per the closed-world assumption).

The lookups for the message declaration and the corresponding method are performed using a depth-first strategy. A message to self necessarily requires the use of dynamic binding but a caching mechanism is used to improve performance in subsequent messages.

Template and modes

::+callable

Errors

- Message is a variable:
  instantiation_error
- Message is neither a variable nor a callable term:
  type_error(callable, Message)
- Message, with predicate indicator Functor/Arity, is declared private:
  permission_error(access, private_predicate, Functor/Arity)
- Message, with predicate indicator Functor/Arity, is not declared:
  existence_error(predicate_declaration, Functor/Arity)

Examples

area(Area) :-
  ::width(Width),
  ::height(Height),
  Area is Width*Height.

**Description**

Calls an imported or inherited predicate definition. The call fails if the predicate is declared but there is no imported or inherited predicate definition (as per the closed-world assumption). This control construct may be used within objects or categories in the body of a predicate definition.

The lookups for the predicate declaration and the predicate definition are performed using a depth-first strategy. Depending on the value of the `optimze` flag, these lookups are performed at compile time whenever sufficient information is available. When the lookups are performed at runtime, a caching mechanism is used to improve performance in subsequent calls.

When the call is made from within an object, the lookup for the predicate definition starts at the imported categories, if any. If an imported predicate definition is not found, the lookup proceeds to the ancestor objects. Calls from predicates defined in complementing categories lookup inherited definitions as if the calls were made from the complemented object, thus allowing more comprehensive object patching. For other categories, the predicate definition lookup is restricted to the extended categories.

The called predicate should be declared public or protected. It may also be declared private if within the scope of the entity where the method making the call is defined.

This control construct is a generalization of the Smalltalk `super` keyword to take into account Logtalk support for prototypes and categories besides classes.

**Template and modes**

```
^^+callable
```

**Errors**

- Predicate is a variable:
  - `instantiation_error`
- Predicate is neither a variable nor a callable term:
  - `type_error(callable, Predicate)`
- Predicate, with predicate indicator `Functor/Arity`, is declared private:
  - `permission_error(access, private_predicate, Functor/Arity)`
- Predicate, with predicate indicator `Functor/Arity`, is not declared:
  - `existence_error(predicate_declaration, Functor/Arity)`

**Examples**

```
init :-
    assertz(counter(0)),
    ^^init.
```

::/2, ::/1, []/1
The control construct allows the programmer to send a message to an object while preserving the original sender. This is mainly used in the definition of object handlers for unknown messages. This functionality is usually known as delegation but be aware that this is an overloaded word that can mean different things in different object-oriented programming languages.

To prevent using this control construct to break object encapsulation, an attempt to delegate a message to the same object as the original sender results in an error. The remaining error conditions are the same as the ::/2 control construct.

Note that, despite the correct functor for this control construct being (traditionally) './2, we refer to it as []/1 simply to emphasize that the syntax is a list with a single element.

Template and modes

Errors

Object and the original sender are the same object:
permission_error(access, object, Sender)

Either Object or Message is a variable:
instantiation_error

Object is not a valid object identifier:
type_error(object_identifier, Object)

Message is neither a variable nor a callable term:
type_error(callable, Message)

Message, with predicate indicator Functor/Arity, is declared private:
permission_error(access, private_predicate, Functor/Arity)

Message, with predicate indicator Functor/Arity, is declared protected:
permission_error(access, protected_predicate, Functor/Arity)

Message, with predicate indicator Functor/Arity, is not declared:
existence_error(predicate_declaration, Functor/Arity)

Object does not exist:
existence_error(object, Object)

Proxy is a variable:
instantiation_error

Proxy is not a valid object identifier:
type_error(object_identifier, Proxy)

The predicate Proxy does not exist in the user pseudo-object:
existence_error(procedure, ProxyFunctor/ProxyArity)
Examples

```
forward(Message) :-
    [backup::Message].
```

`forward/1`
This control construct allows the programmer to bypass the Logtalk compiler. It can be used to wrap a source file term (either a clause or a directive) to bypass the term-expansion mechanism. Similarly, it can be used to wrap a goal to bypass the goal-expansion mechanism. When used to wrap a goal, it is opaque to cuts and the argument is called within the context of the pseudo-object user. It is also possible to use (Closure) as the first argument of call/2-N calls. In this case, Closure will be extended with the remaining arguments of the call/2-N call in order to construct a goal that will be called within the context of user. It can also be used as a message to any object. This is useful when the message is e.g. a conjunction of messages, some of which being calls to Prolog built-in predicates.

This control construct may also be used in place of an object identifier when sending a message. In this case, the result of proving its argument as a goal (within the context of the pseudo-object user) is used as an object identifier in the message sending call. This feature is mainly used with parametric objects when the their identifiers correspond to predicates defined in user.

### Template and modes

```
(+callable)
```

### Errors

- Term or Goal is a variable:
  - instantiation_error
- Term or Goal is neither a variable nor a callable term:
  - type_error(callable, Goal)

### Examples

```
{:- load_foreign_resource(file)}.
N1/*1 < N2/*2 :-
  {N1*D2 < N2*D1}.

call_in_user(F, X, Y, Z) :-
call({F}, X, Y, Z).

| ?- {circle(Id, Radius, Color)}::area(Area).
  ...?
| ?- logtalk::{write('Hello world!'), nl}.
  Hello world!
  yes
```
<</2

Description

Object<<Message
{Proxy}<<Message

Calls a goal within the context of the specified object. Goal is called with the execution context (sender, this, and self) set to Object. Goal may need to be written within brackets to avoid parsing errors due to operator clashes. This control construct should only be used for debugging or for writing unit tests. This control construct can only be used for objects compiled with the compiler flag `context_switching_calls` set to allow. Set this compiler flag to deny to disable this control construct and thus preventing using it to break encapsulation.

The `{Proxy}<<Message` syntax allows simplified access to parametric object proxies. Its operational semantics is equivalent to the goal conjunction (call(Proxy), Proxy<<Message). I.e. Proxy is proved within the context of the pseudo-object user and, if successful, the goal term is used as a parametric object identifier. Exceptions thrown when proving Proxy are handled by the <</2 control construct. This syntax construct supports backtracking over the `{Proxy}` goal.

Caveat: although the goal argument is fully compiled before calling, some of the necessary information for the second compiler pass may not be available at runtime.

Template and modes

```
+object_identifier<<<callable
{+object_identifier}<<<callable
```

Errors

Either Object or Goal is a variable:
instantiation_error

Object is neither a variable nor a valid object identifier:
type_error(object_identifier, Object)

Goal is neither a variable nor a callable term:
type_error(callable, Goal)

Object does not contain a local definition for the Goal predicate:
existence_error(procedure, Goal)

Object does not exist:
existence_error(object, Object)

Object was created/compiled with support for context switching calls turned off:
permission_error(access, database, Goal)

Examples

```
test(member) :-
  list << member(1, [1]).
```
